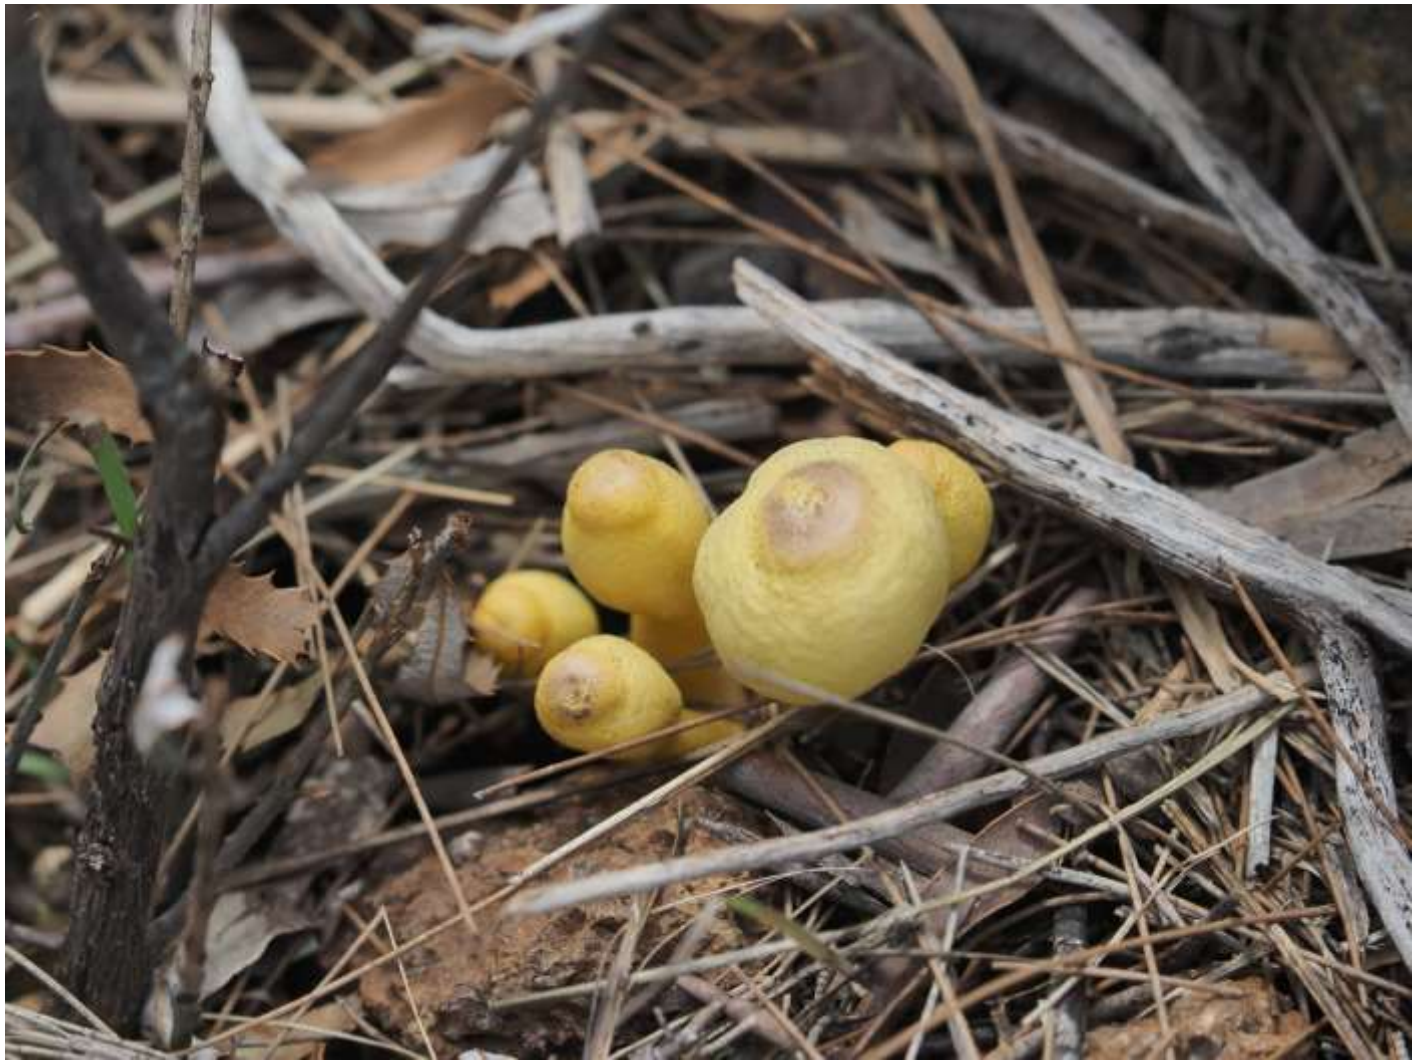
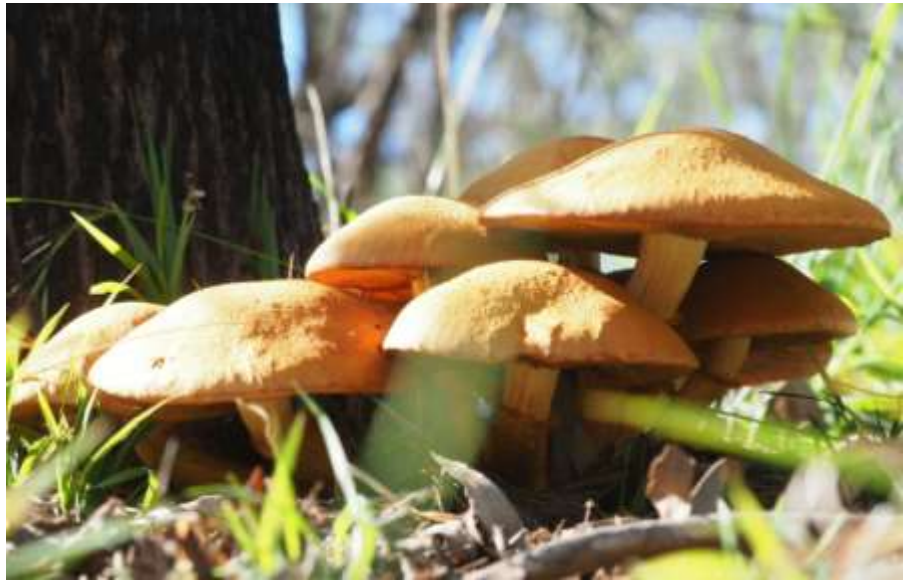
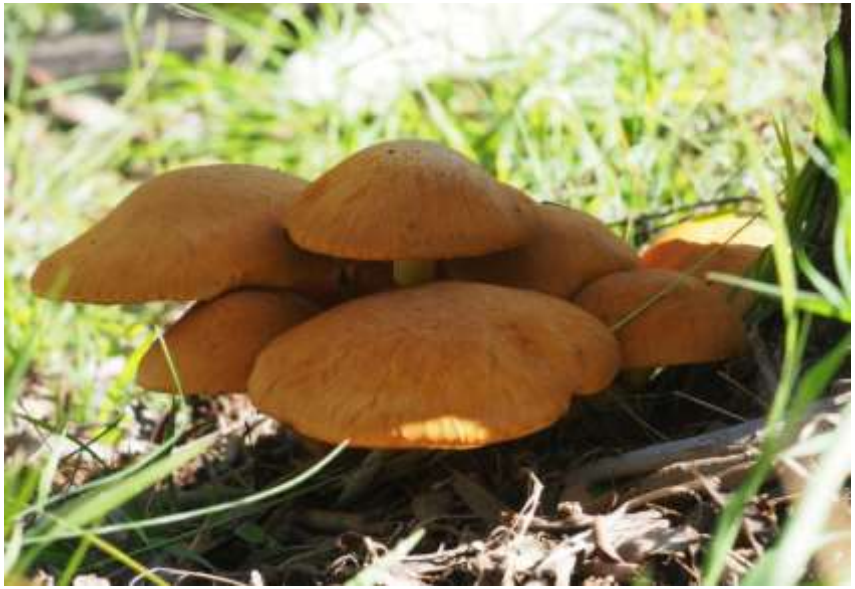
Fungus at Umbagong District Park, Latham, ACT: Part 1

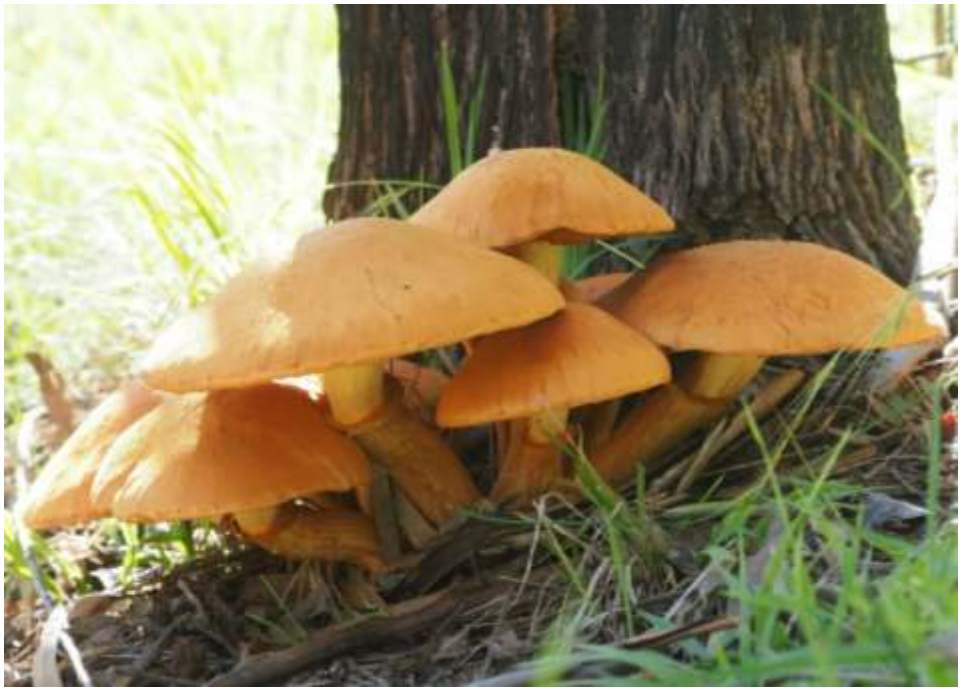


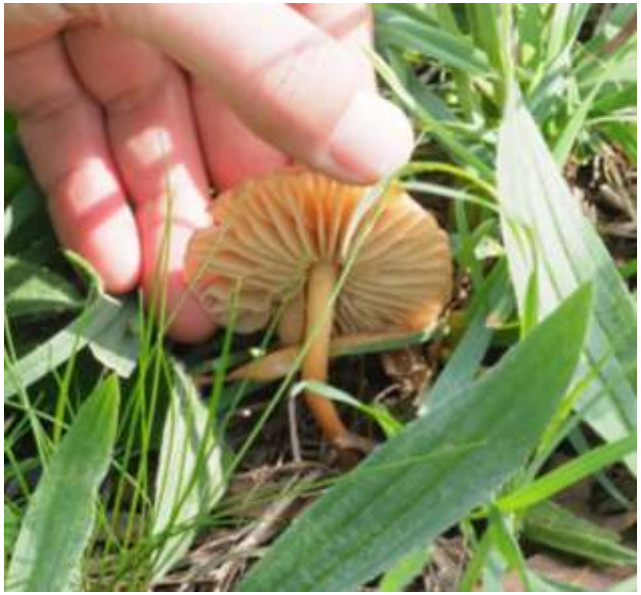
Approximate location: Lat: -35.2152139; Long: 149.0261306 **Date:** 16 February 2020 **Identification:** *Leucocoprinus birnbaumii*
Comments: This fungus reportedly a tropical or sub-tropical variety often found in pot plants. May have been introduced into the park via a landcare planting.
Photographs: Eric & Caroline Wenger
Identification: With grateful thanks to Heino Lepp for his assistance with identification.



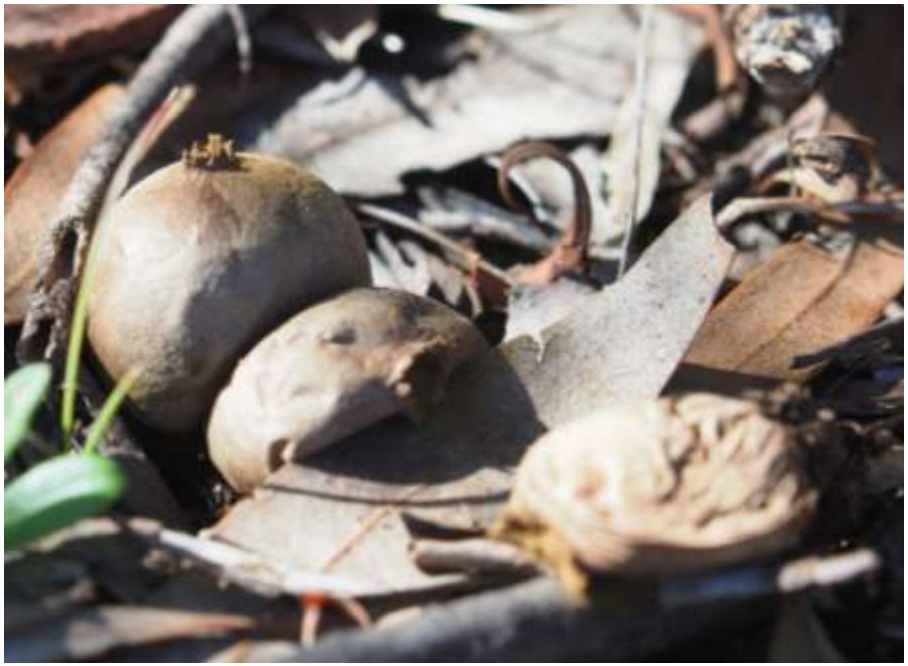


Approximate location: Lat: -35.2145056; Long: 149.021325 **Date:** 10 May 2020 **Comments:** several clumps, all of them under dead *Hakea salicifolia*
Identification: *Gymnopilus junonius*

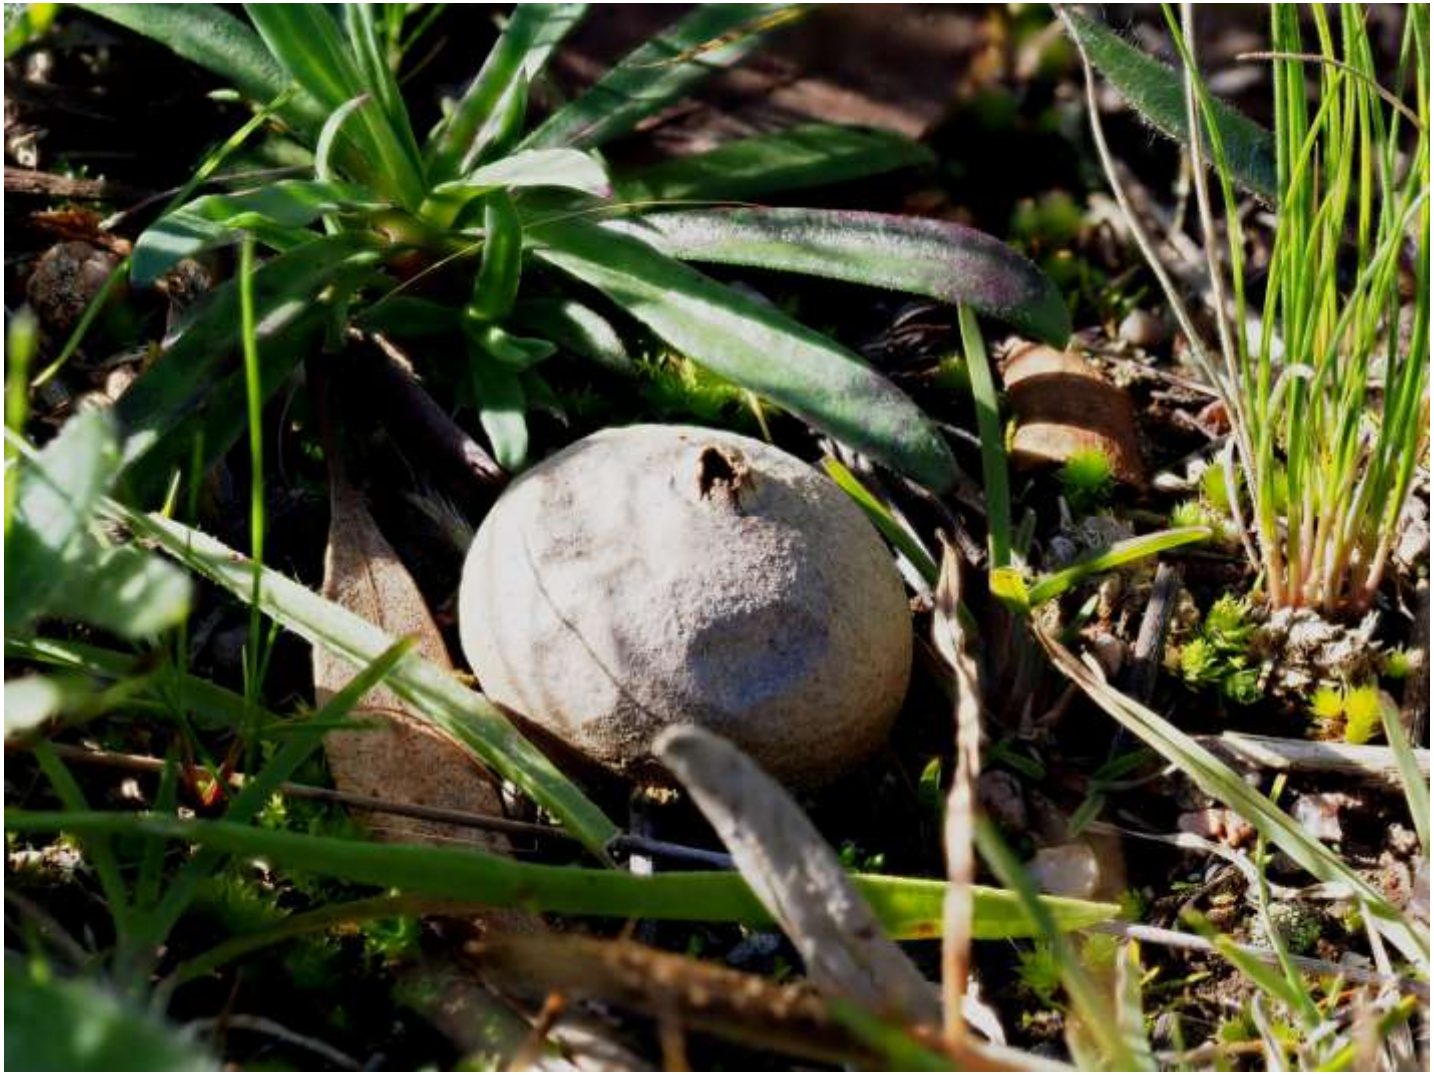




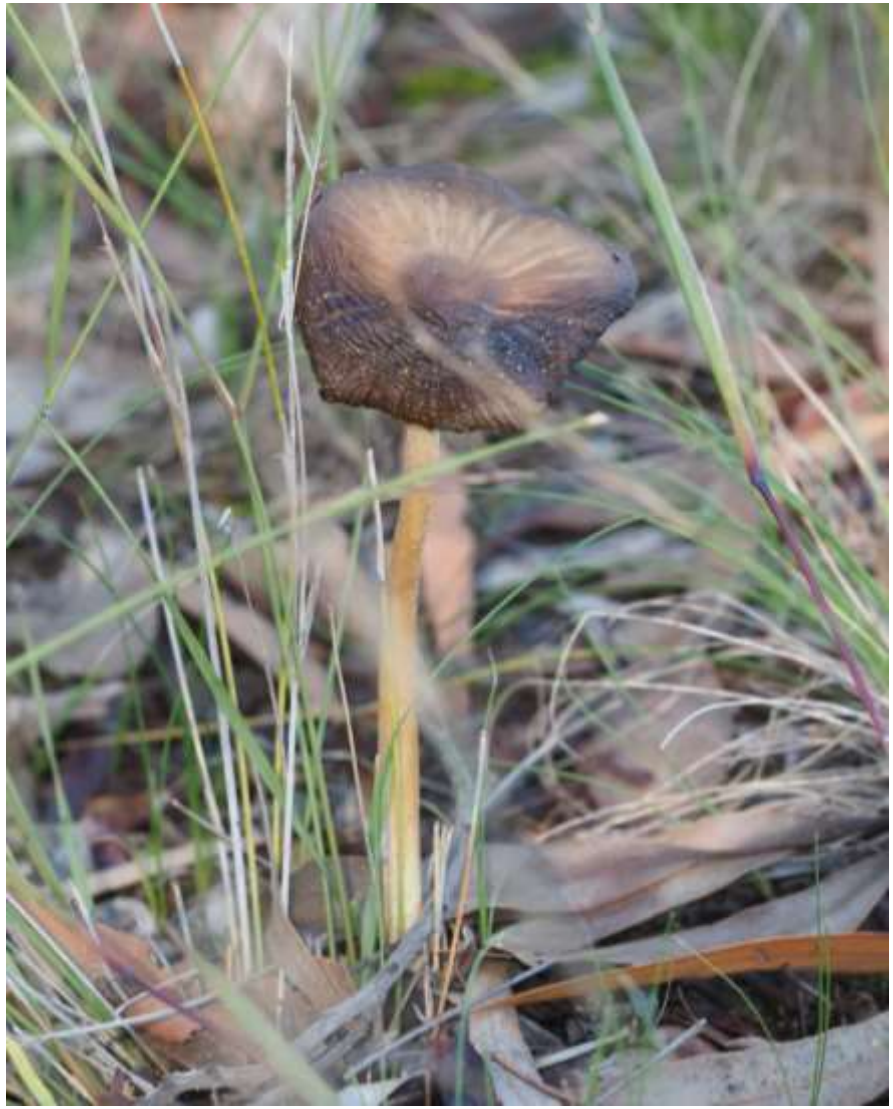
Approximate location: Lat: -35.2143167; Long: 149.02375 **Date:** 10 May 2020 **Identification:** unknown **Comments:** under eucalypts



Approximate location: Lat: -35.2143167; Long: 149.02375 **Date:** 10 May 2020 **Identification:** *Bovista sp.*



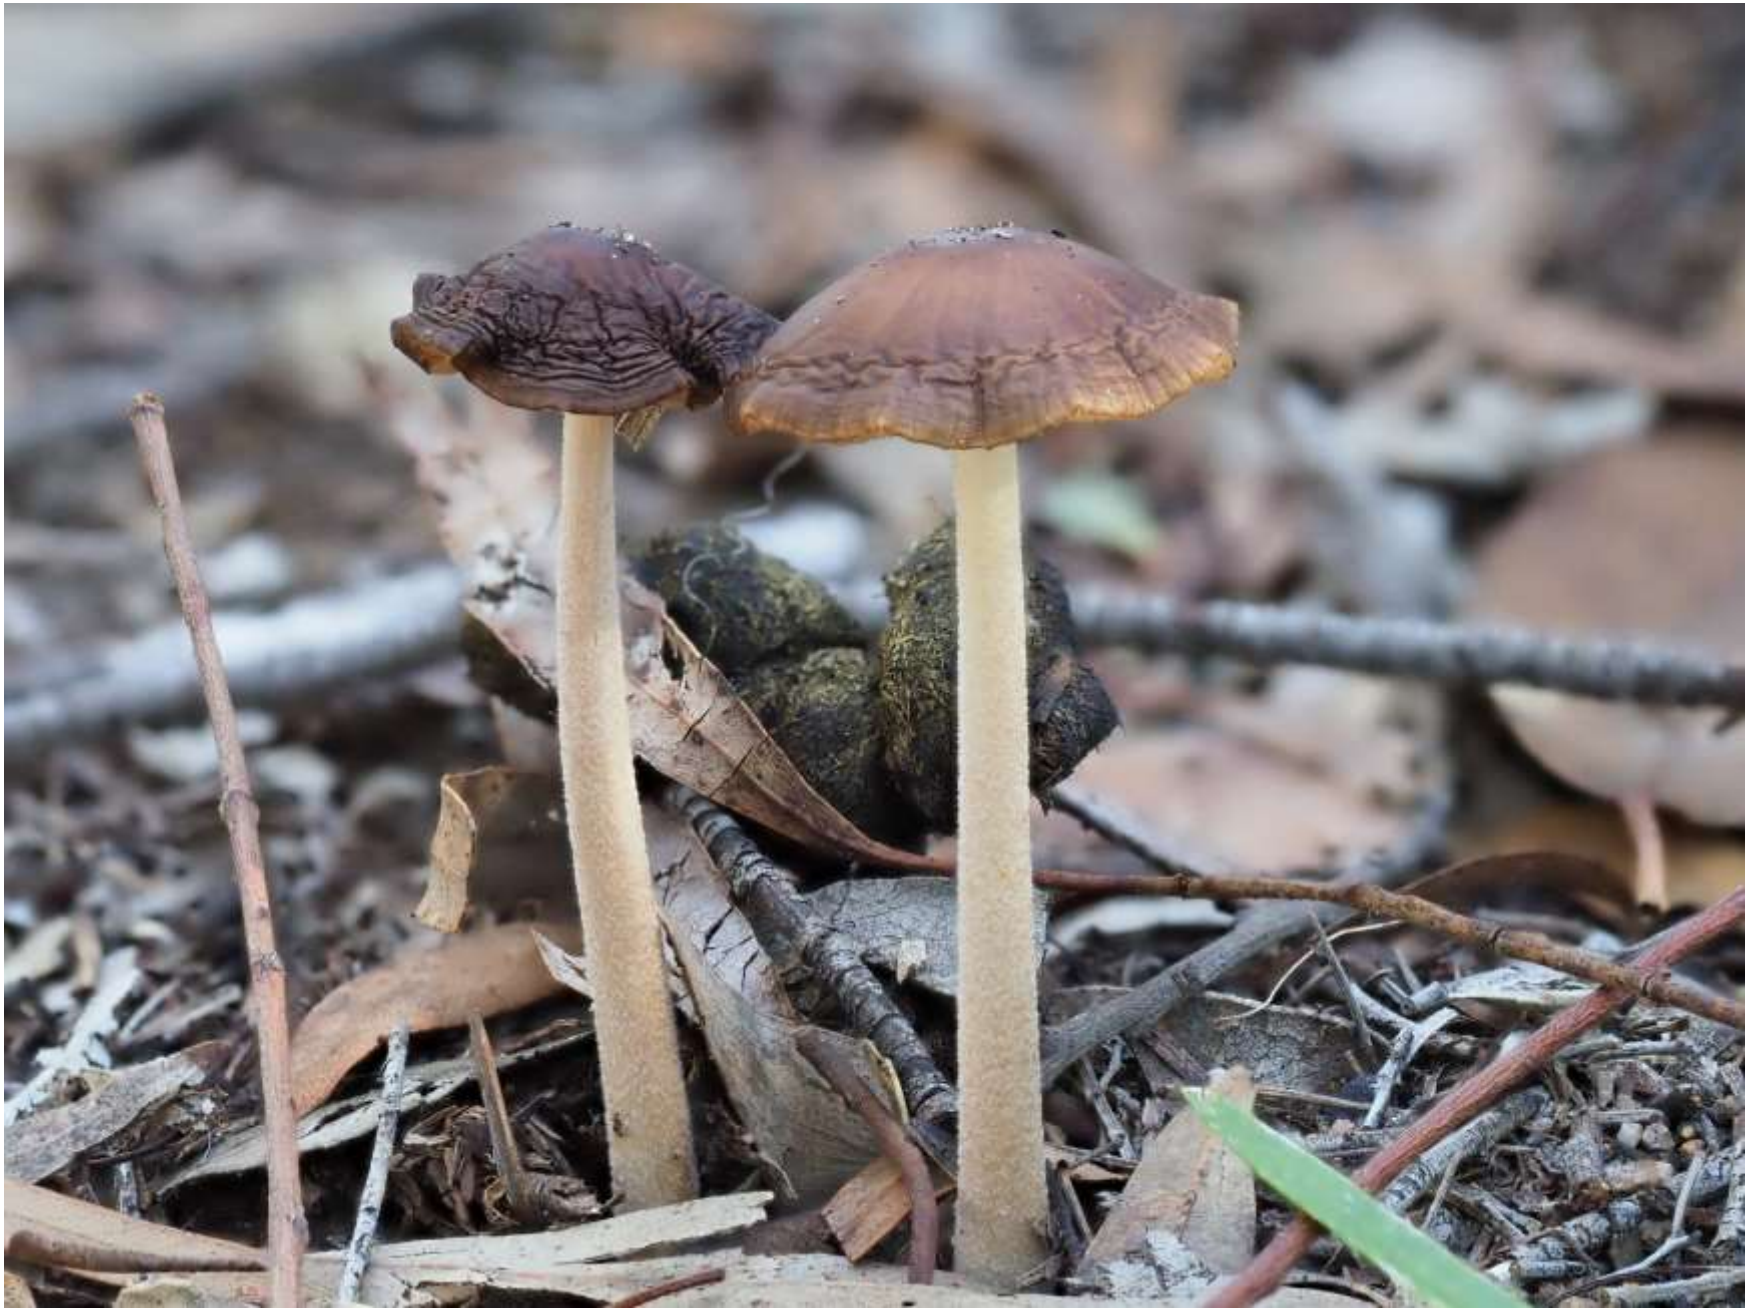
Approximate location: Lat: -35.213525; Long: 149.0255778 **Date:** 5 June 2020 **Identification:** *Bovista sp*.



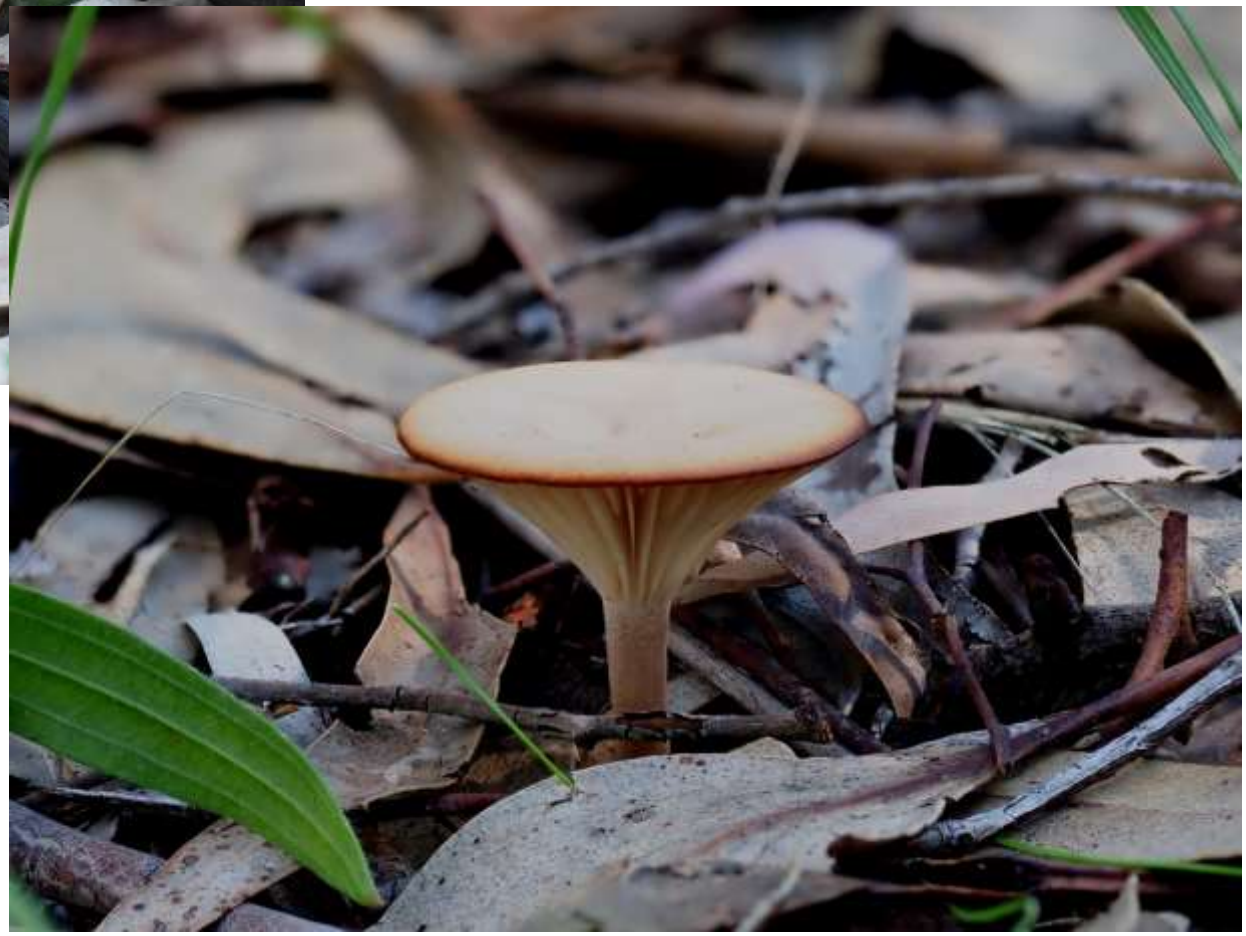
Approximate location: Lat: -35.213525; Long: 149.0255778 **Date:** 10 May 2020 (above) 5 June 2020 (below) **Comments:** The same species at different stages

Identification (above and following 2 pages)**:** *Oudemansiella radicata* group

Comment: photo below: has what is probably a species of *Tapeigaster* clinging to the top of the stem; it's a common fly on mushrooms (Heino Lepp). This kind of fungus has been found in other parts of the park, including Lat: -35.216423; Long: 149.020959 and Lat: -35.212280; Long: 149.031331.



Approximate location: Lat: -35.213525; Long: 149.0255778 **Date:** 5 June 2020 **Identification:** as above

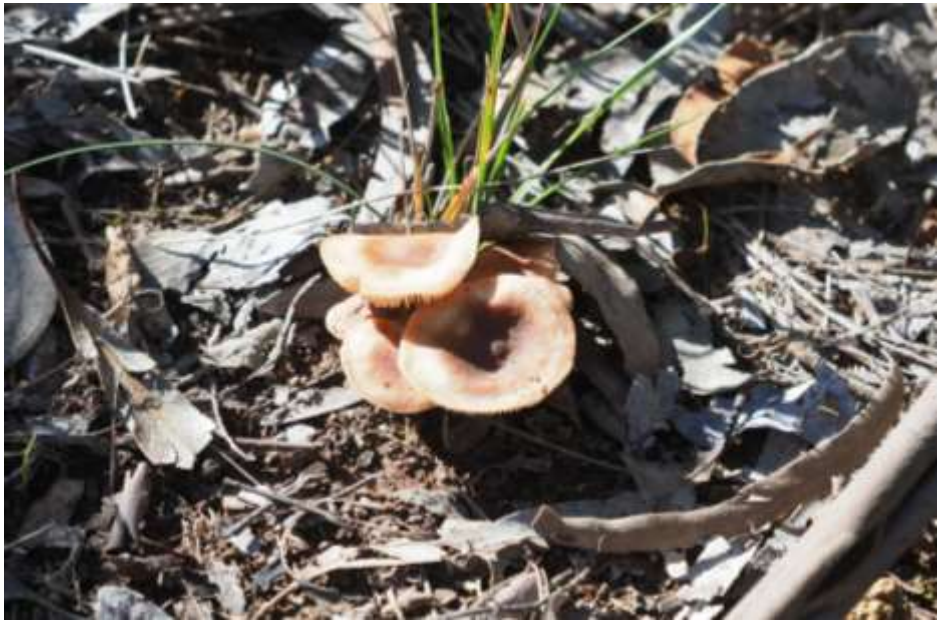


Approximate location: Lat: -35.2137972; Long: 149.0256834

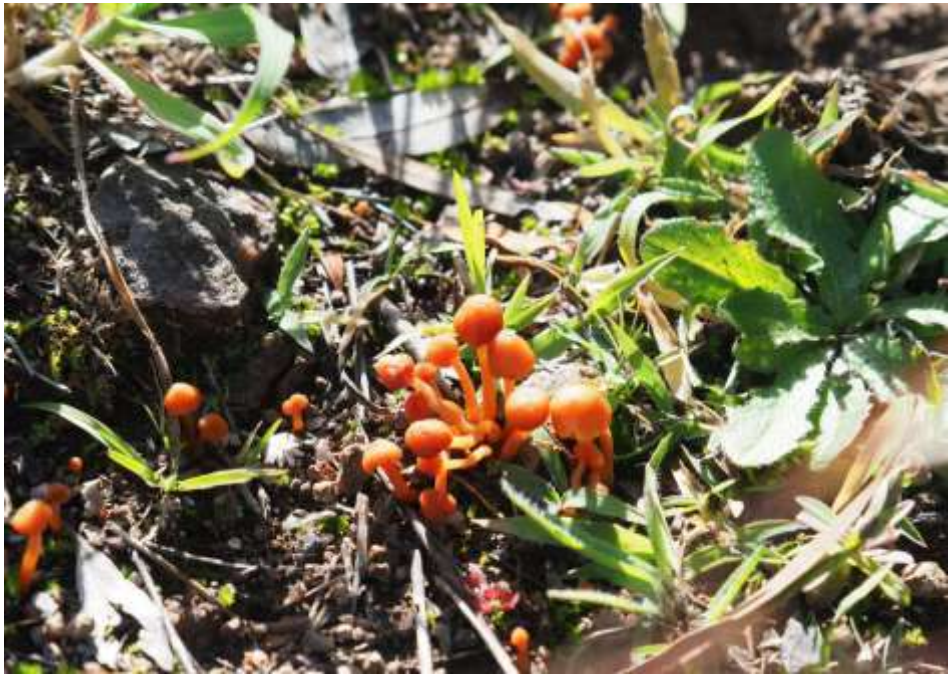
Date: 5 June 2020

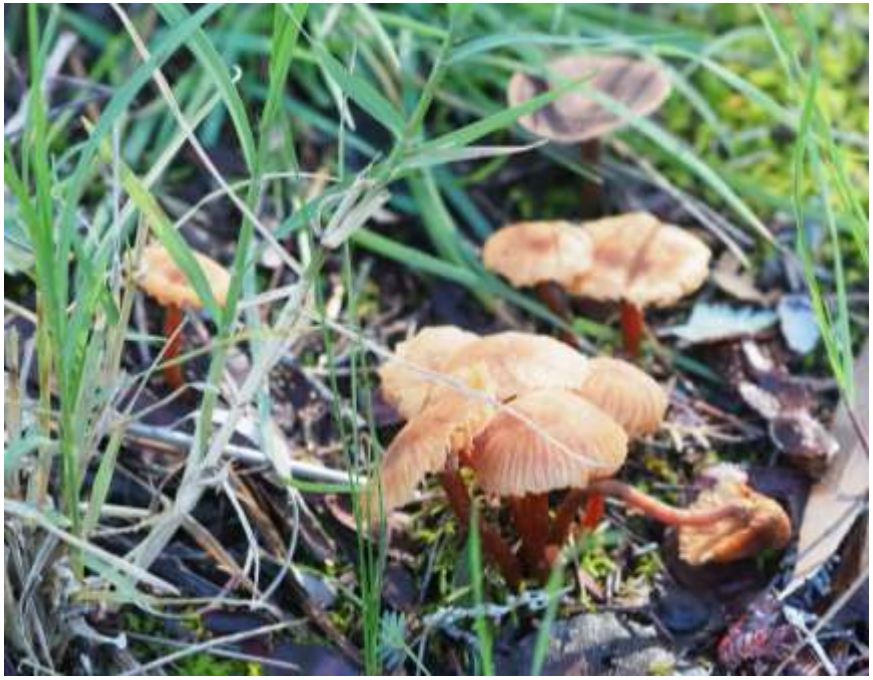
Identification: unknown

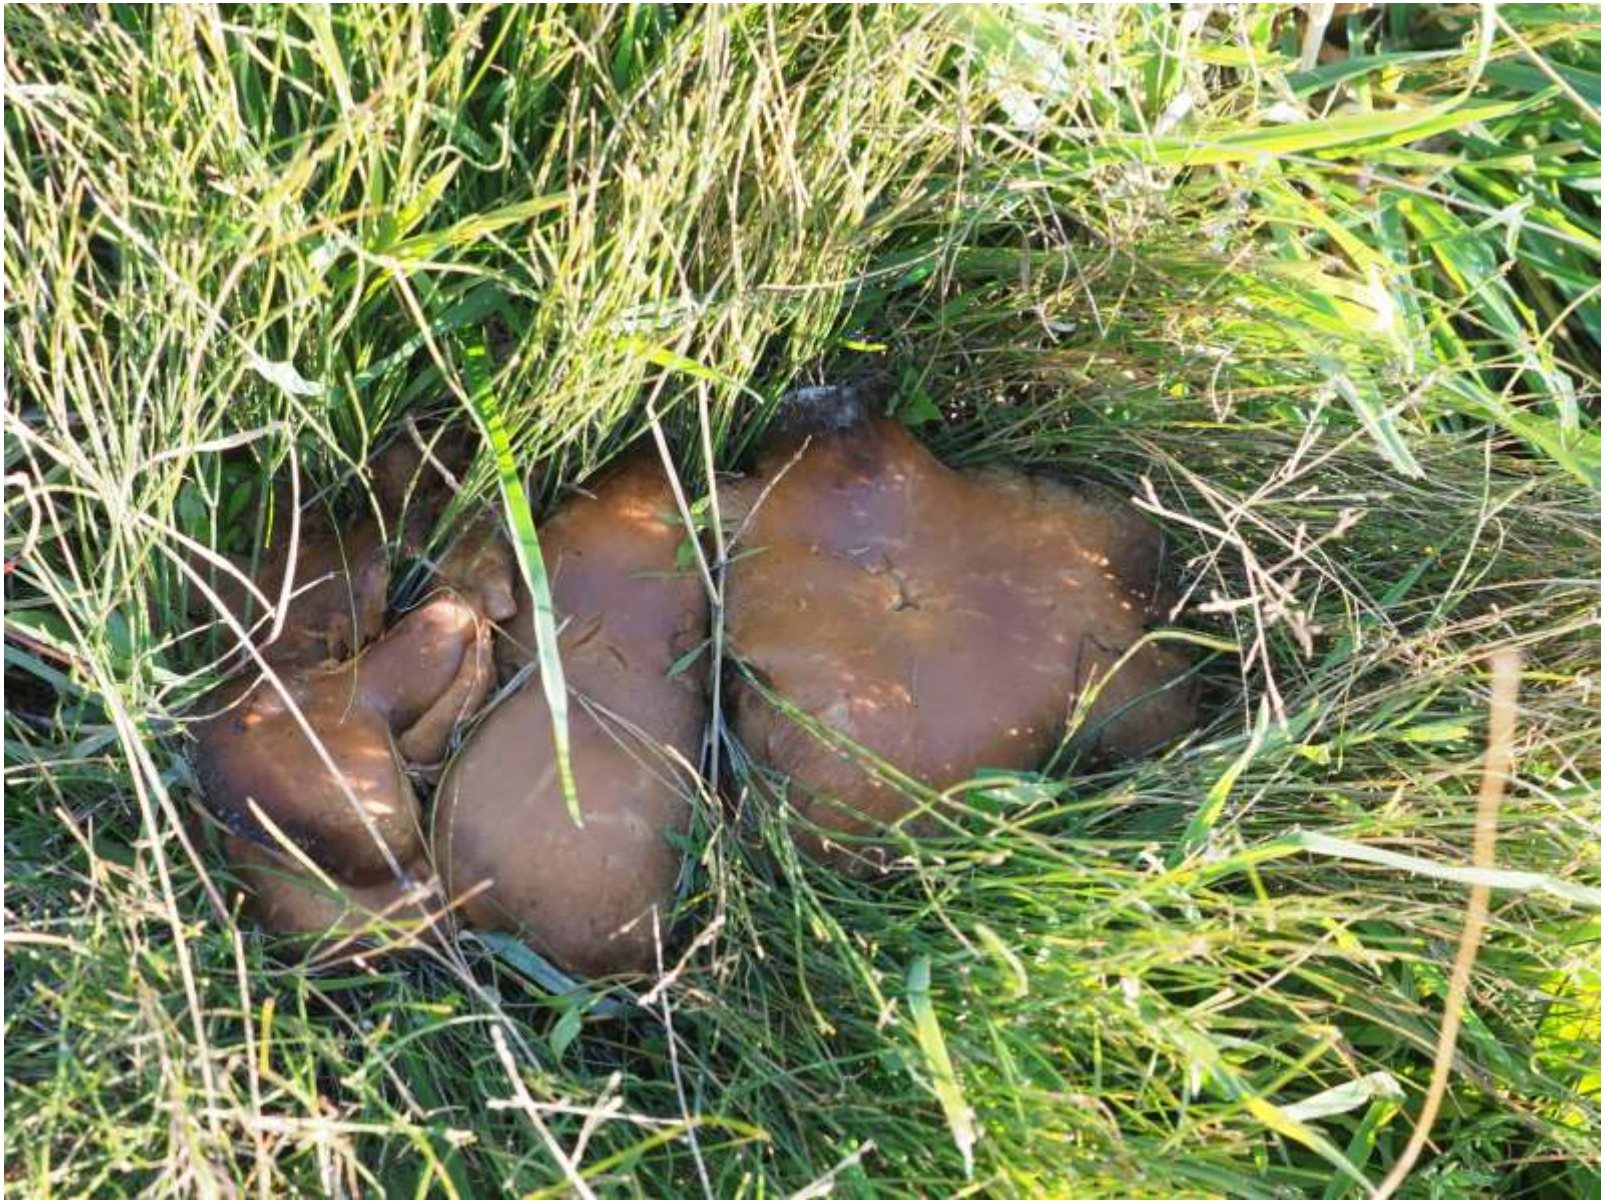
Comments: Under eucalypts



Approximate location of above & below: -35.2130583; Long: 149.0255278 **Date:** 10 May 2020 **Identification** (above left): unknown
Identification (right and below left): *Laccaria sp.* (note all were in the same cluster and appeared to be at different stages of growth)

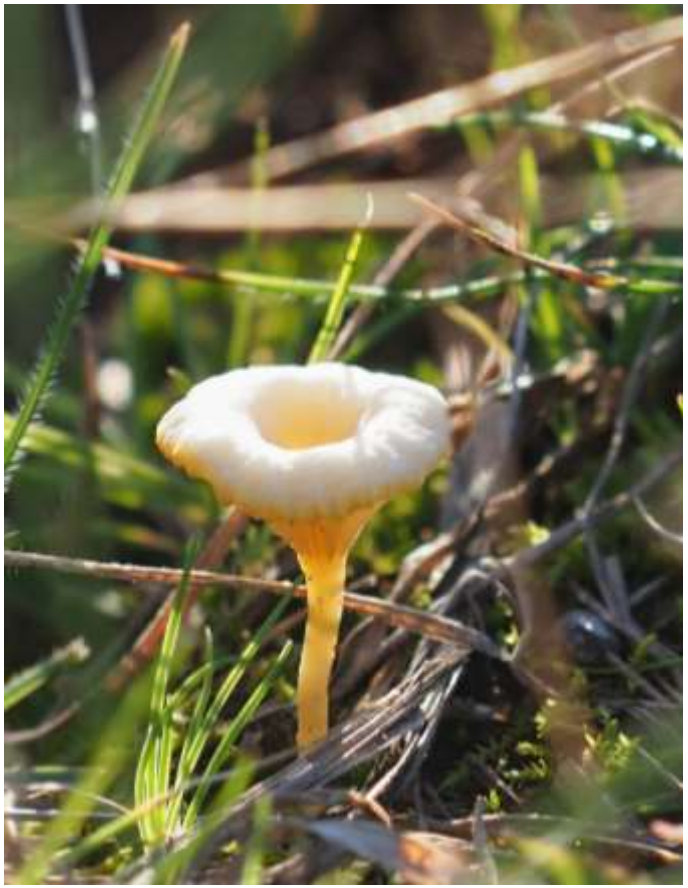


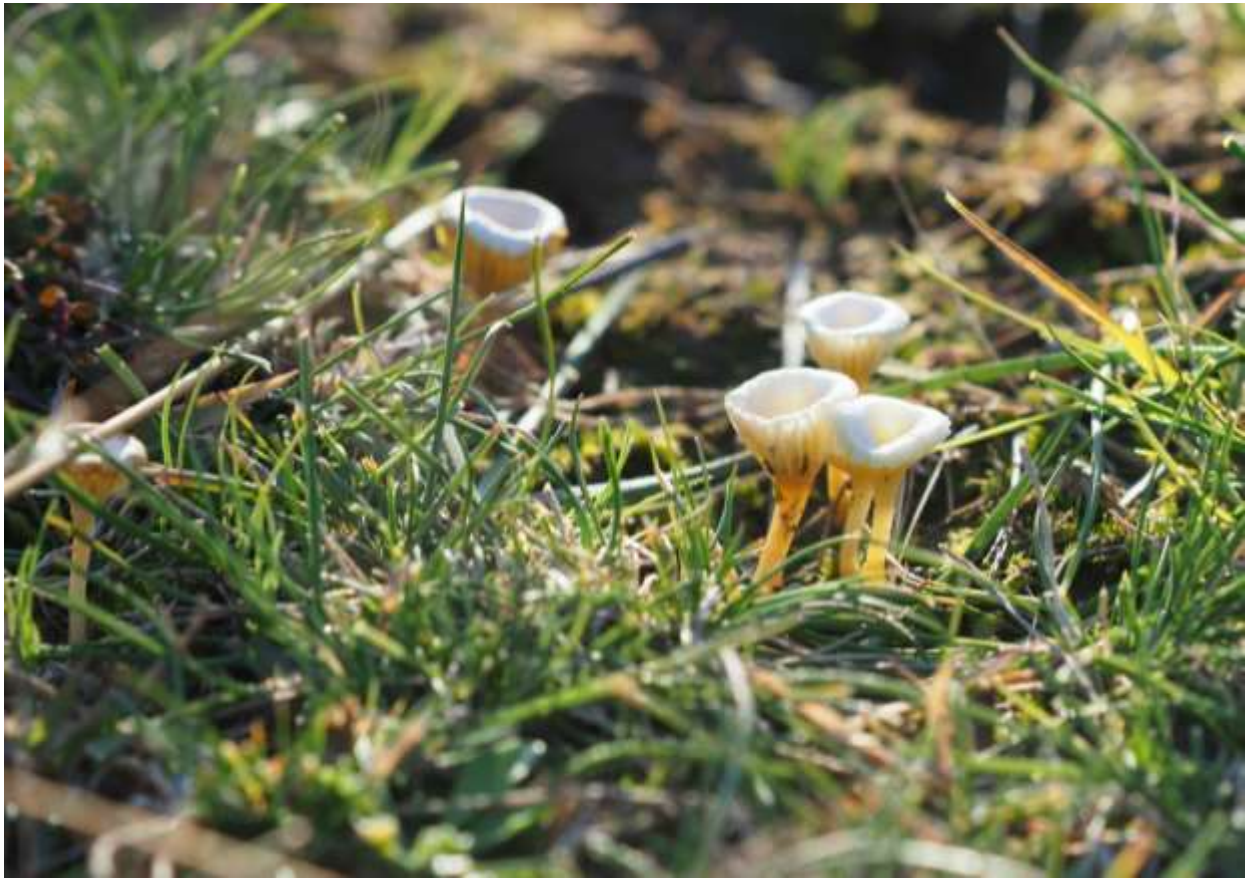




Approximate location: Lat: -35.2137833; Long: 149.0229556 **Date:** 2 June 2020 **Comments:** Like a cowpat in a clump of *Tricoryne elatior*.

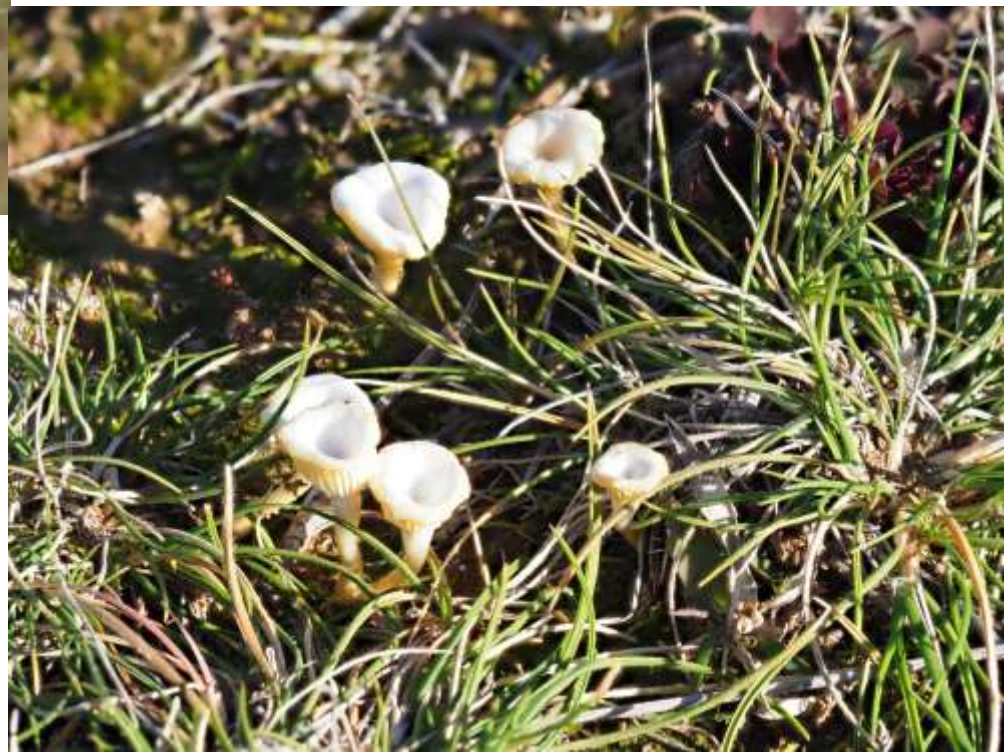
Identification: unknown

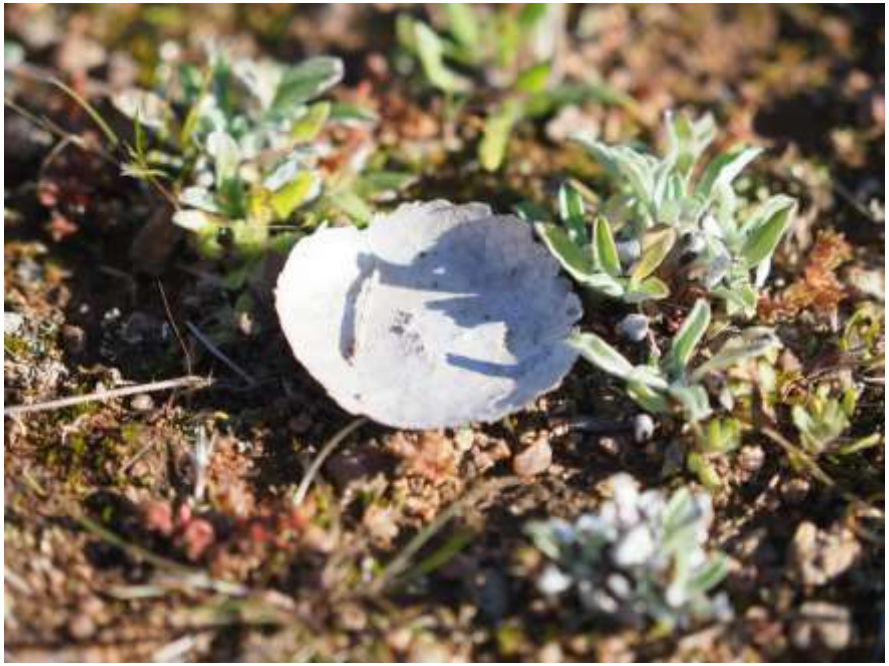


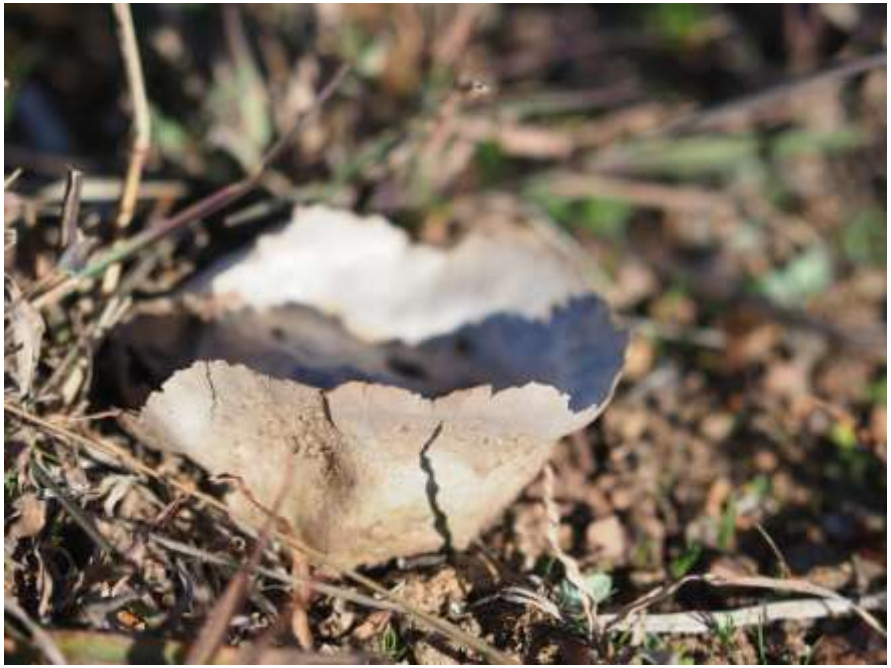


Approximate location: Lat: -35.213925; Long: 149.0231278
Date: 2 June 2020
Identification: *Lichenomphalia chromacea*

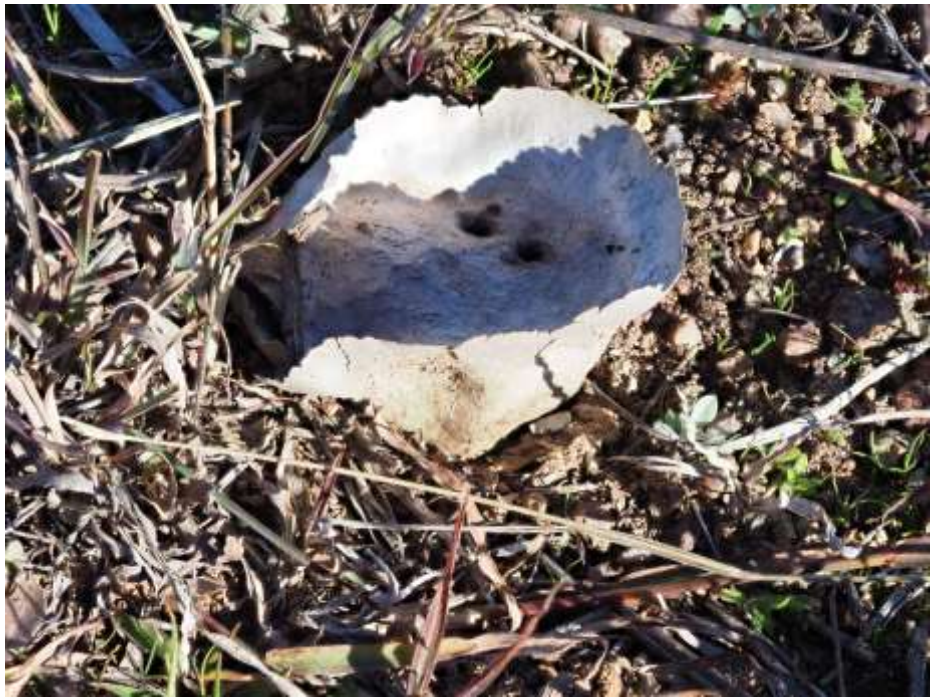
Comment: algal mat at base. Growing in grassland on the edge of a track. Another clump later found at Lat: -35.212044; Long: 149.032199.

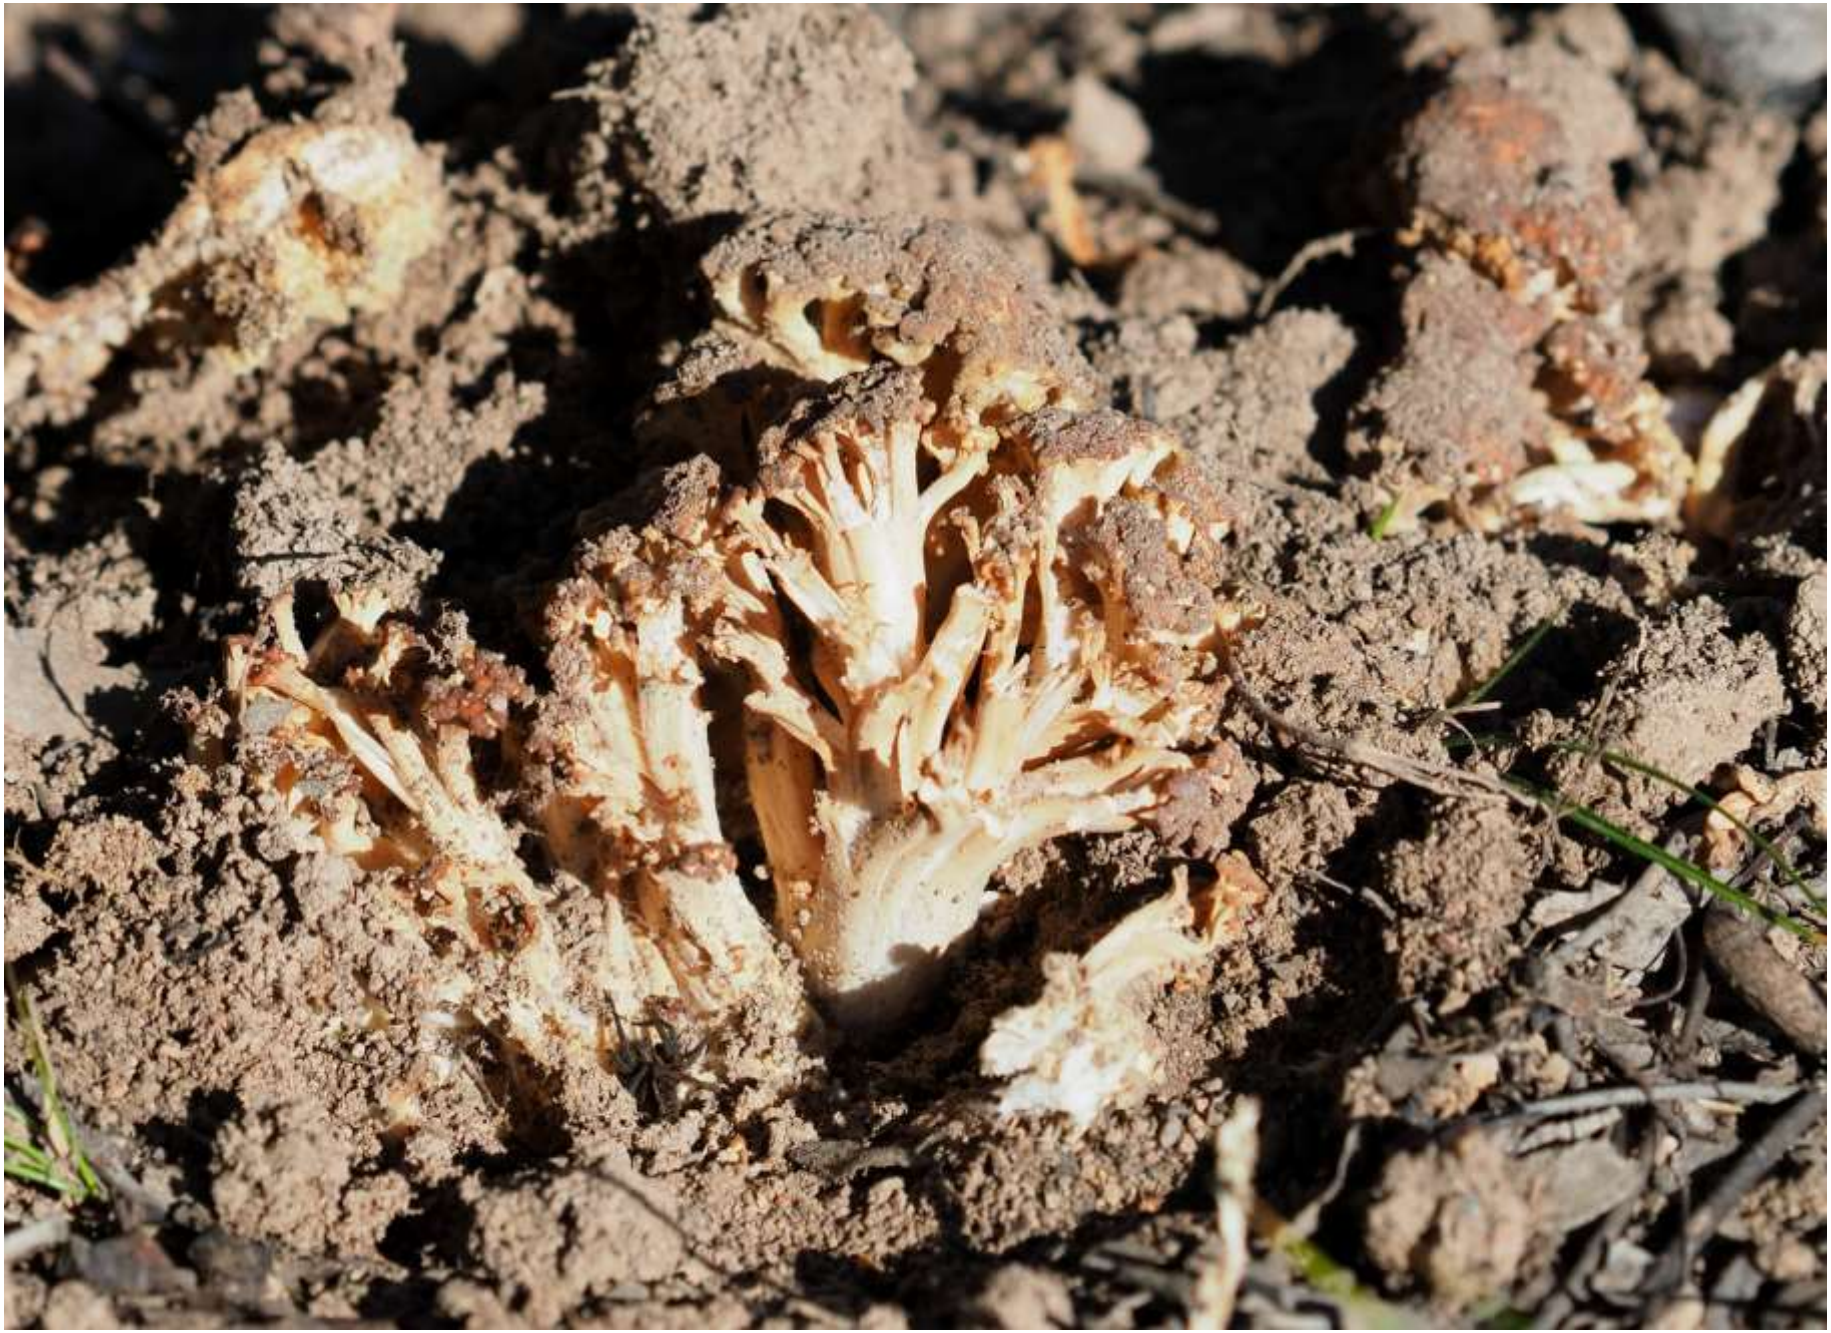




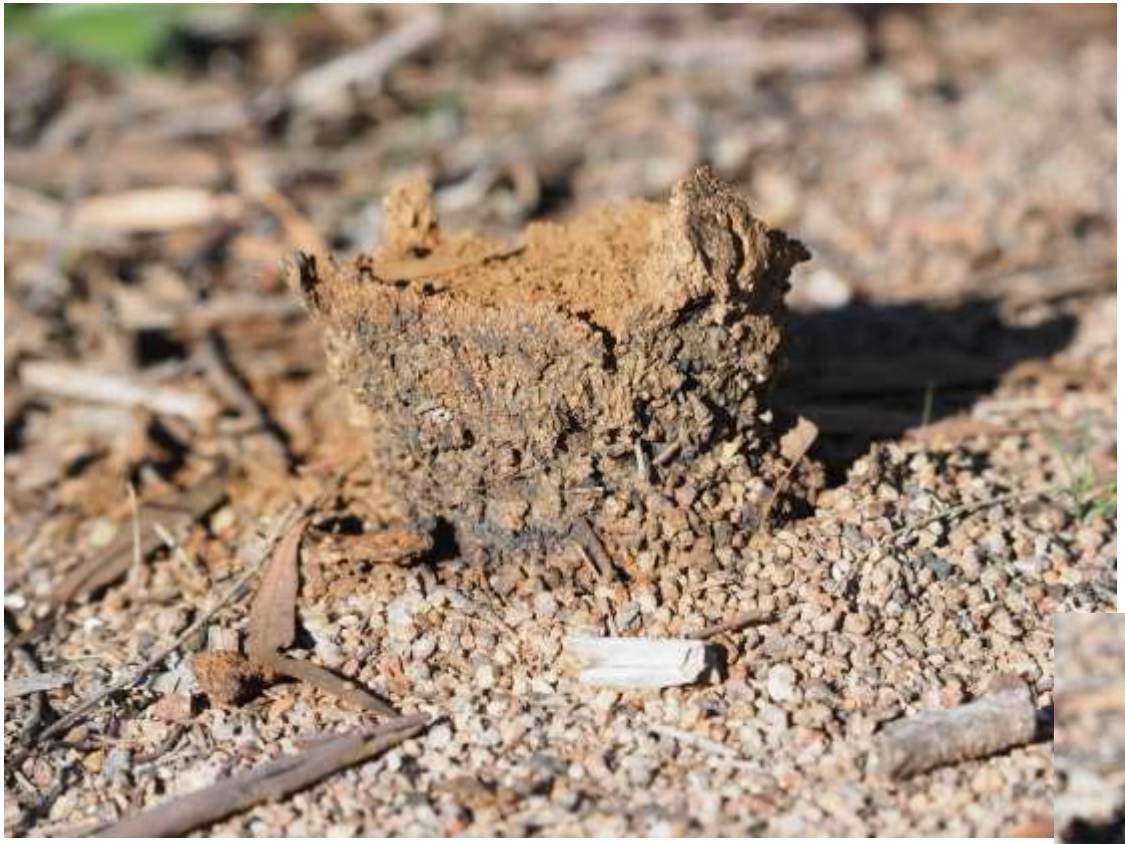


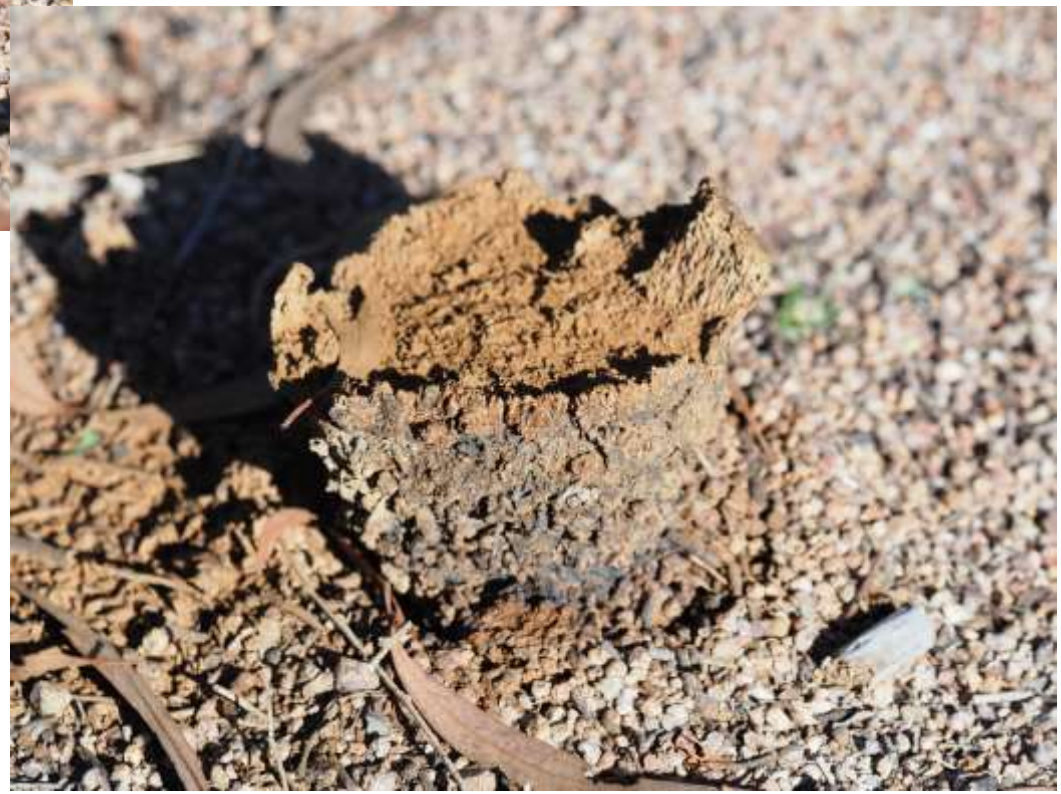
Approximate location: Lat: -35.213925; Long: 149.0231278 **Date:** 2 June 2020 (above); 5 June 2020 (below) **Identification:** *Calvatia cyathiformis*





Approximate location: Lat: -35.2128778; Long: 149.0258139 **Date:** 5 June 2020 **Identification:** *Ramaria sp.*



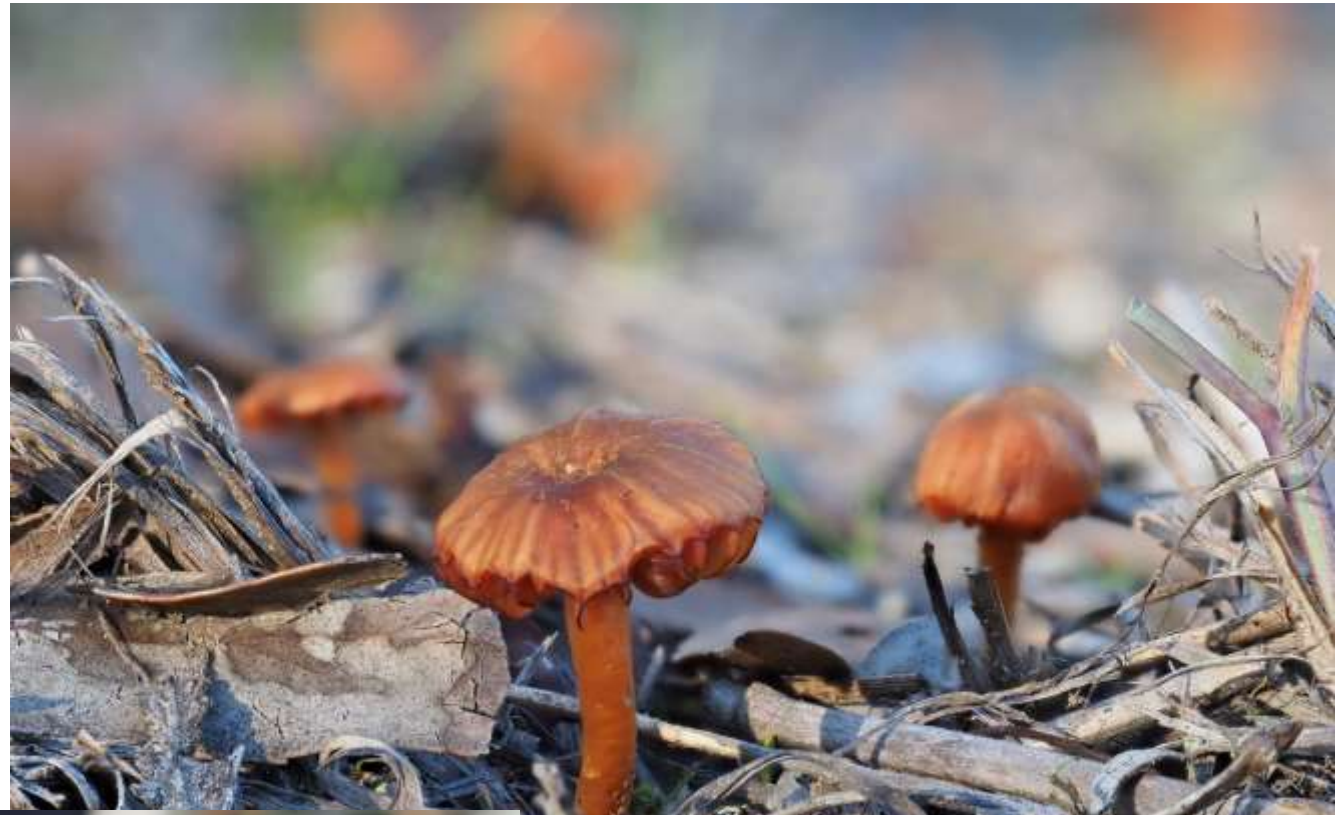


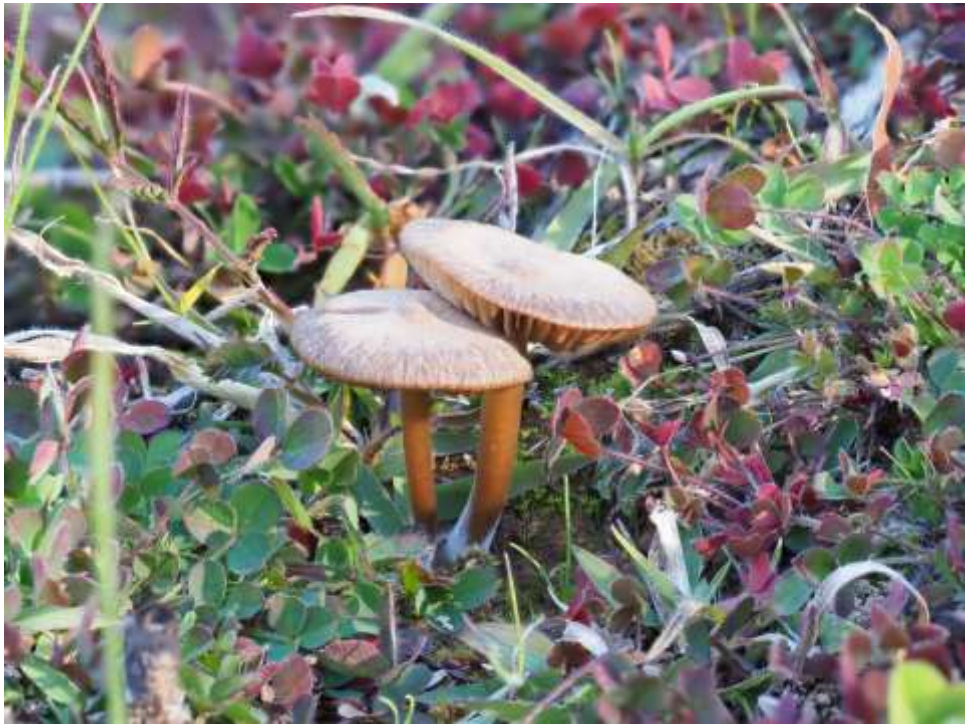
Above and Right

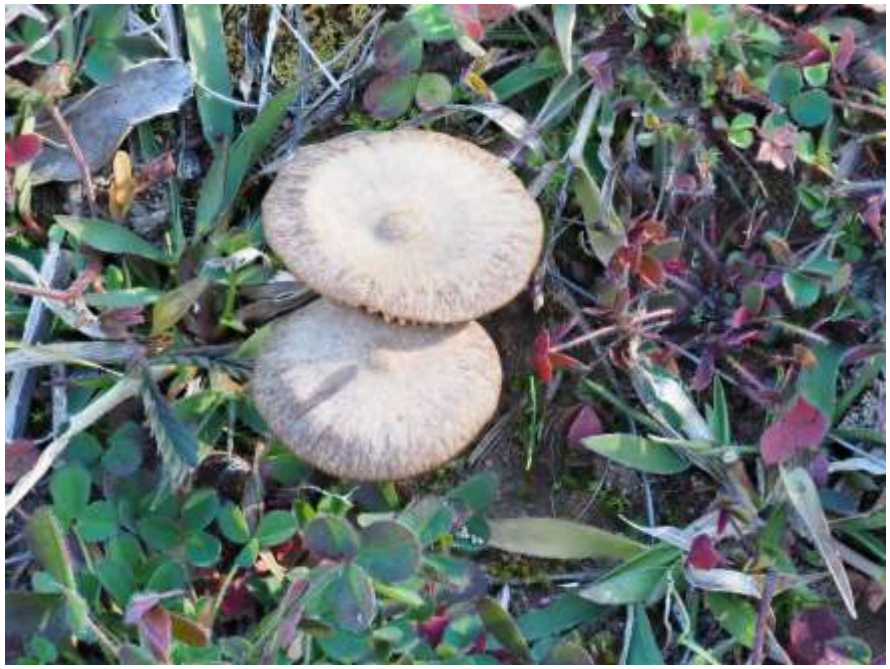
Approximate location: Lat: -35.2128778; Long: 149.0258139
Date: 5 June 2020
Identification: *Pisolithus marmoratus* (likely)

Next Page

Approximate location: Lat: -35.2154667; Long: 149.0273584
Date: 5 June 2020 **Identification:** *Laccaria sp*



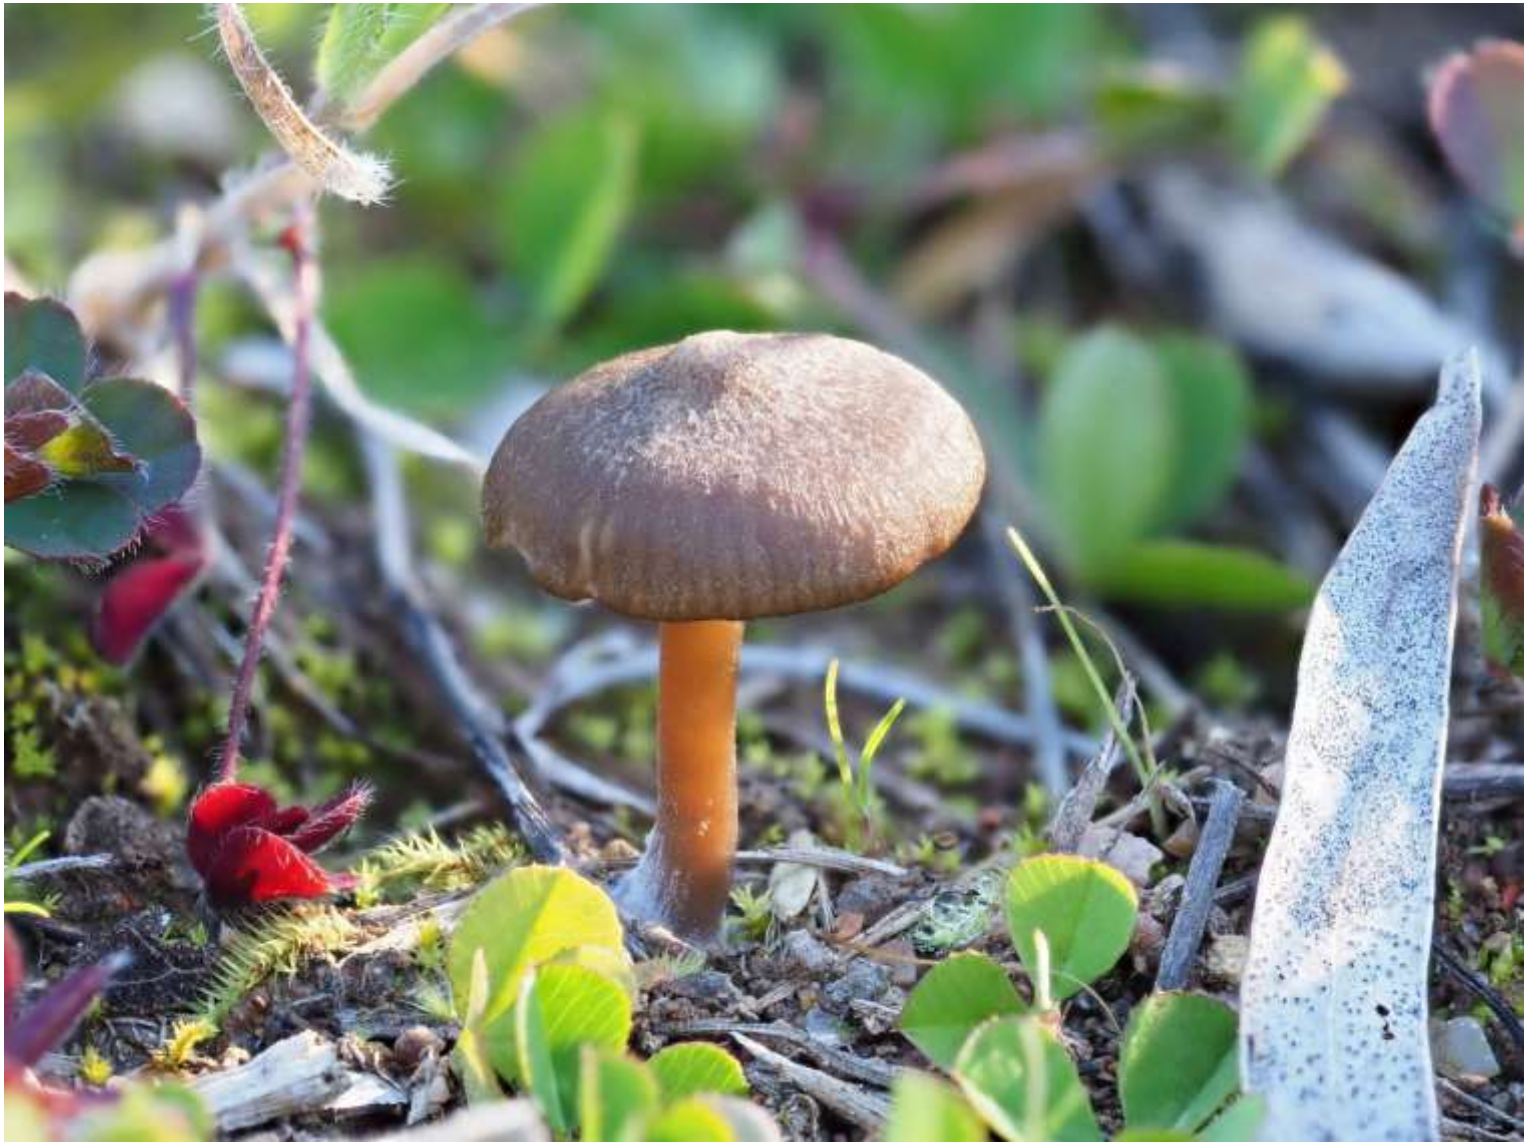


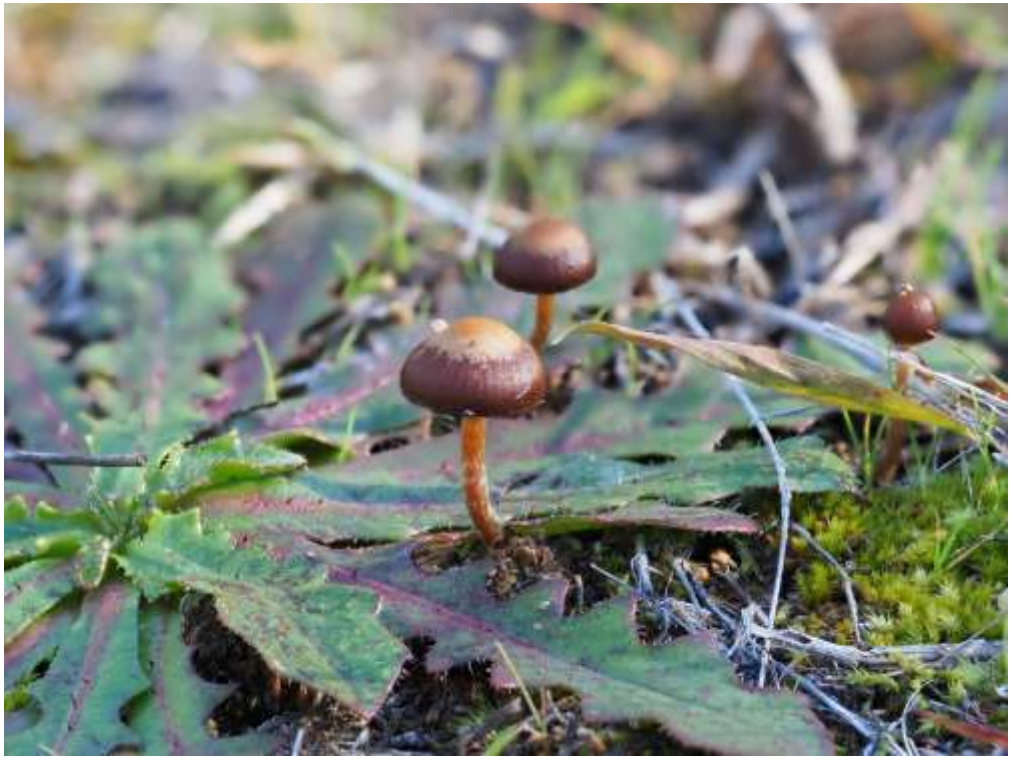


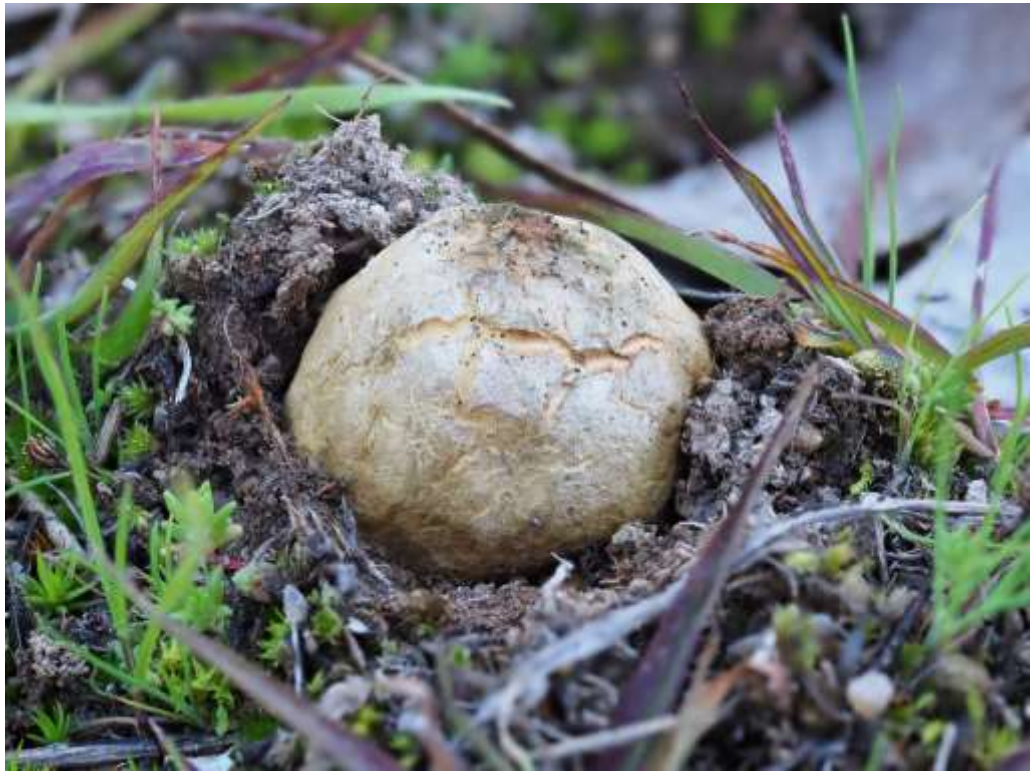
Approximate location: Lat: -35.2149194; Long:149.0262473

Date: 5 June 2020

Identification (above, right and following page): unknown







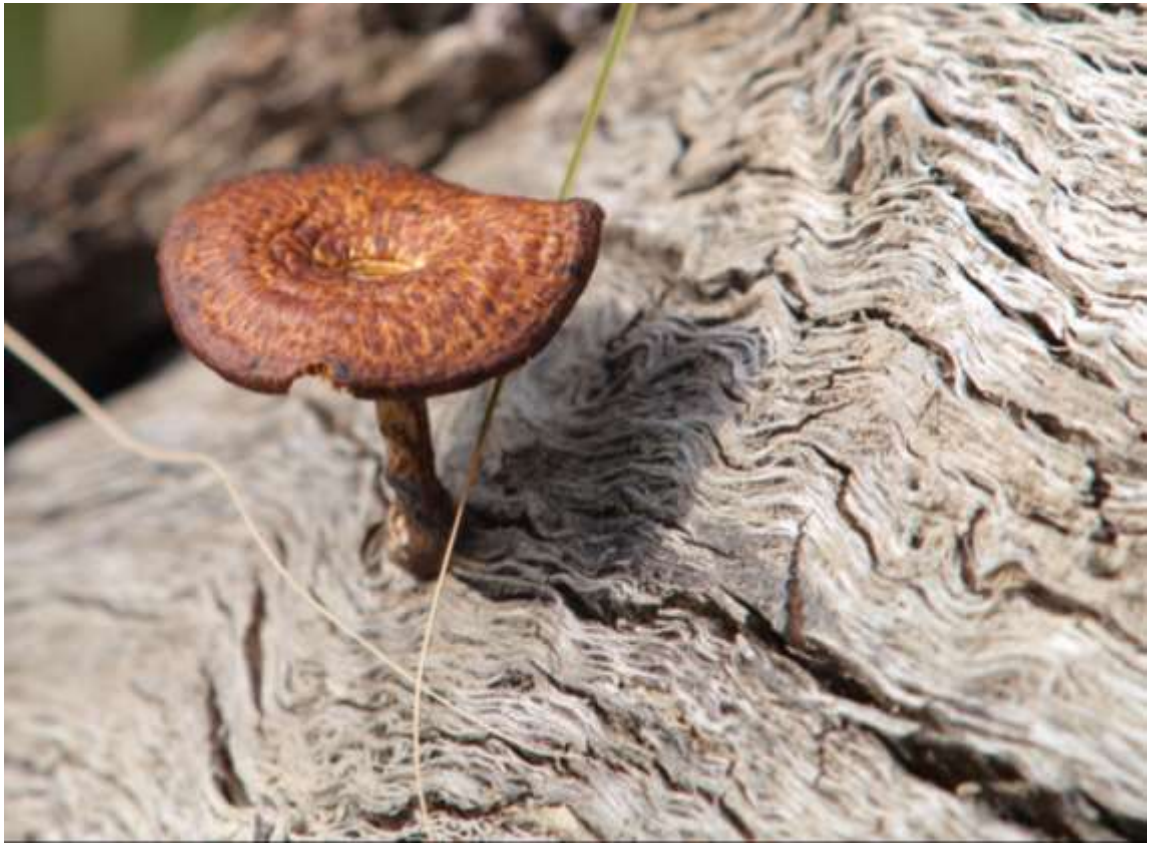
Approximate location: Lat**:** -35.2149444; Long: 149.02605 (both)

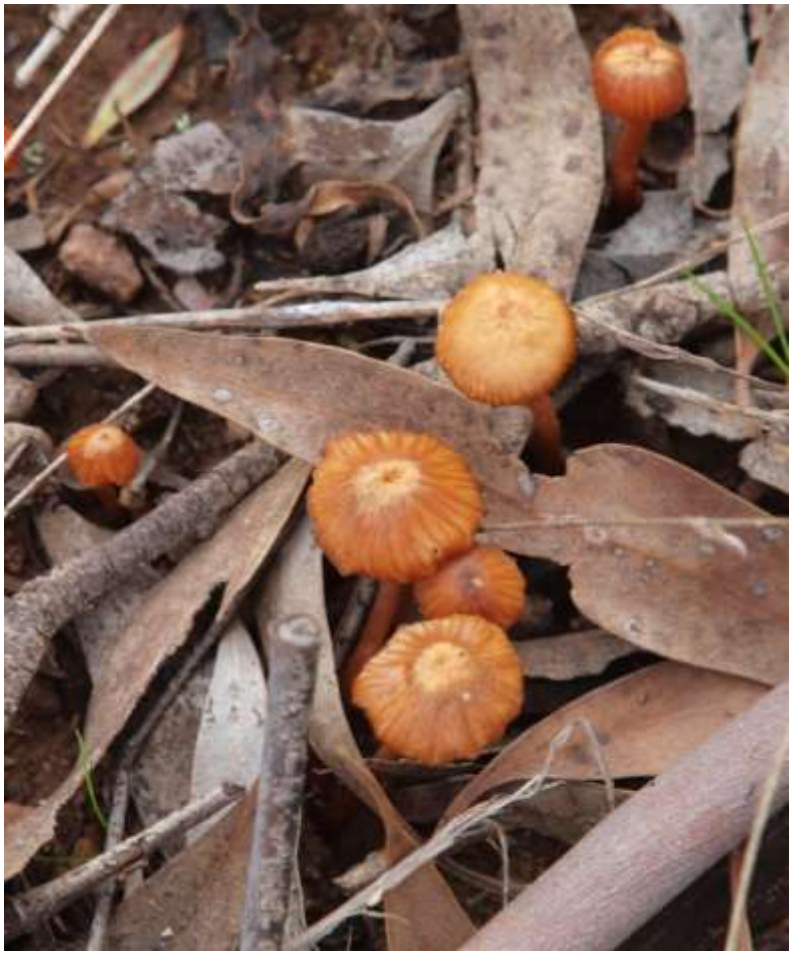
Date: 5 June 2020

Comments: In weedy native grassland. Note the colour variation in the mushrooms (all appeared to be in the same cluster).

Identification (above)**:** more than one genus is possible

Identification (right)**:** *Scleroderma sp.*

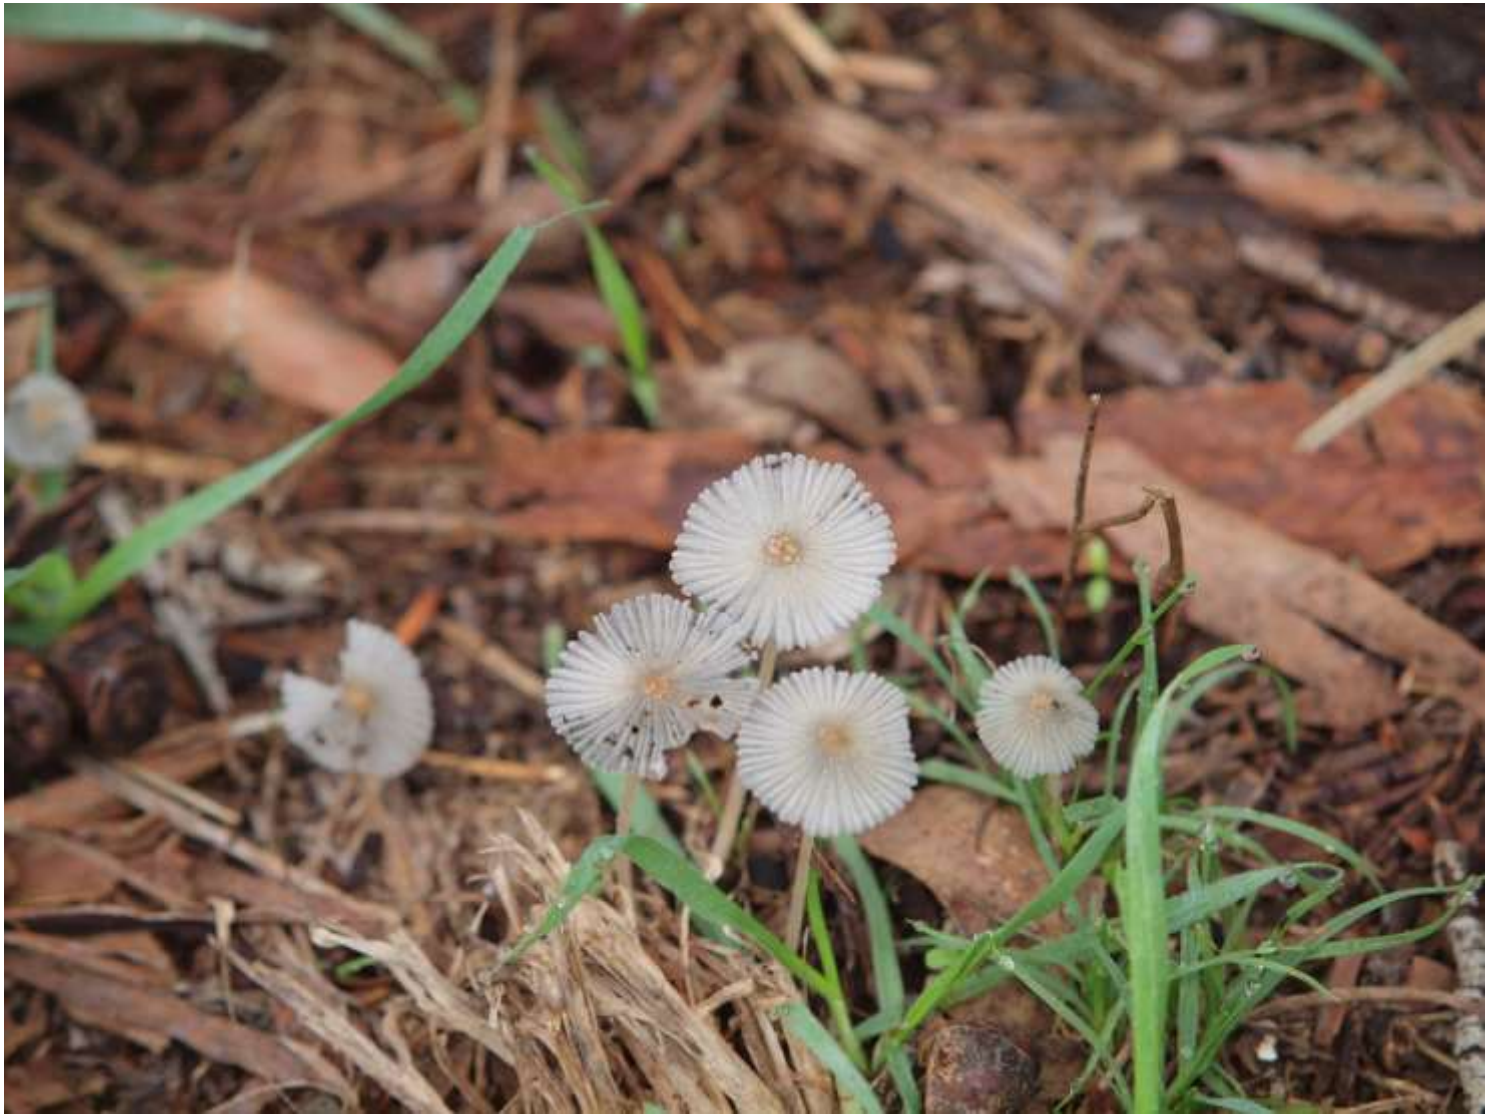




Location: Umbagong District Park

Above **Date:** 28 March 2016 **Identification:** *Polyporus arcularius*

Right **Date:** 7 August 2016 **Identification:** *Laccaria sp.*

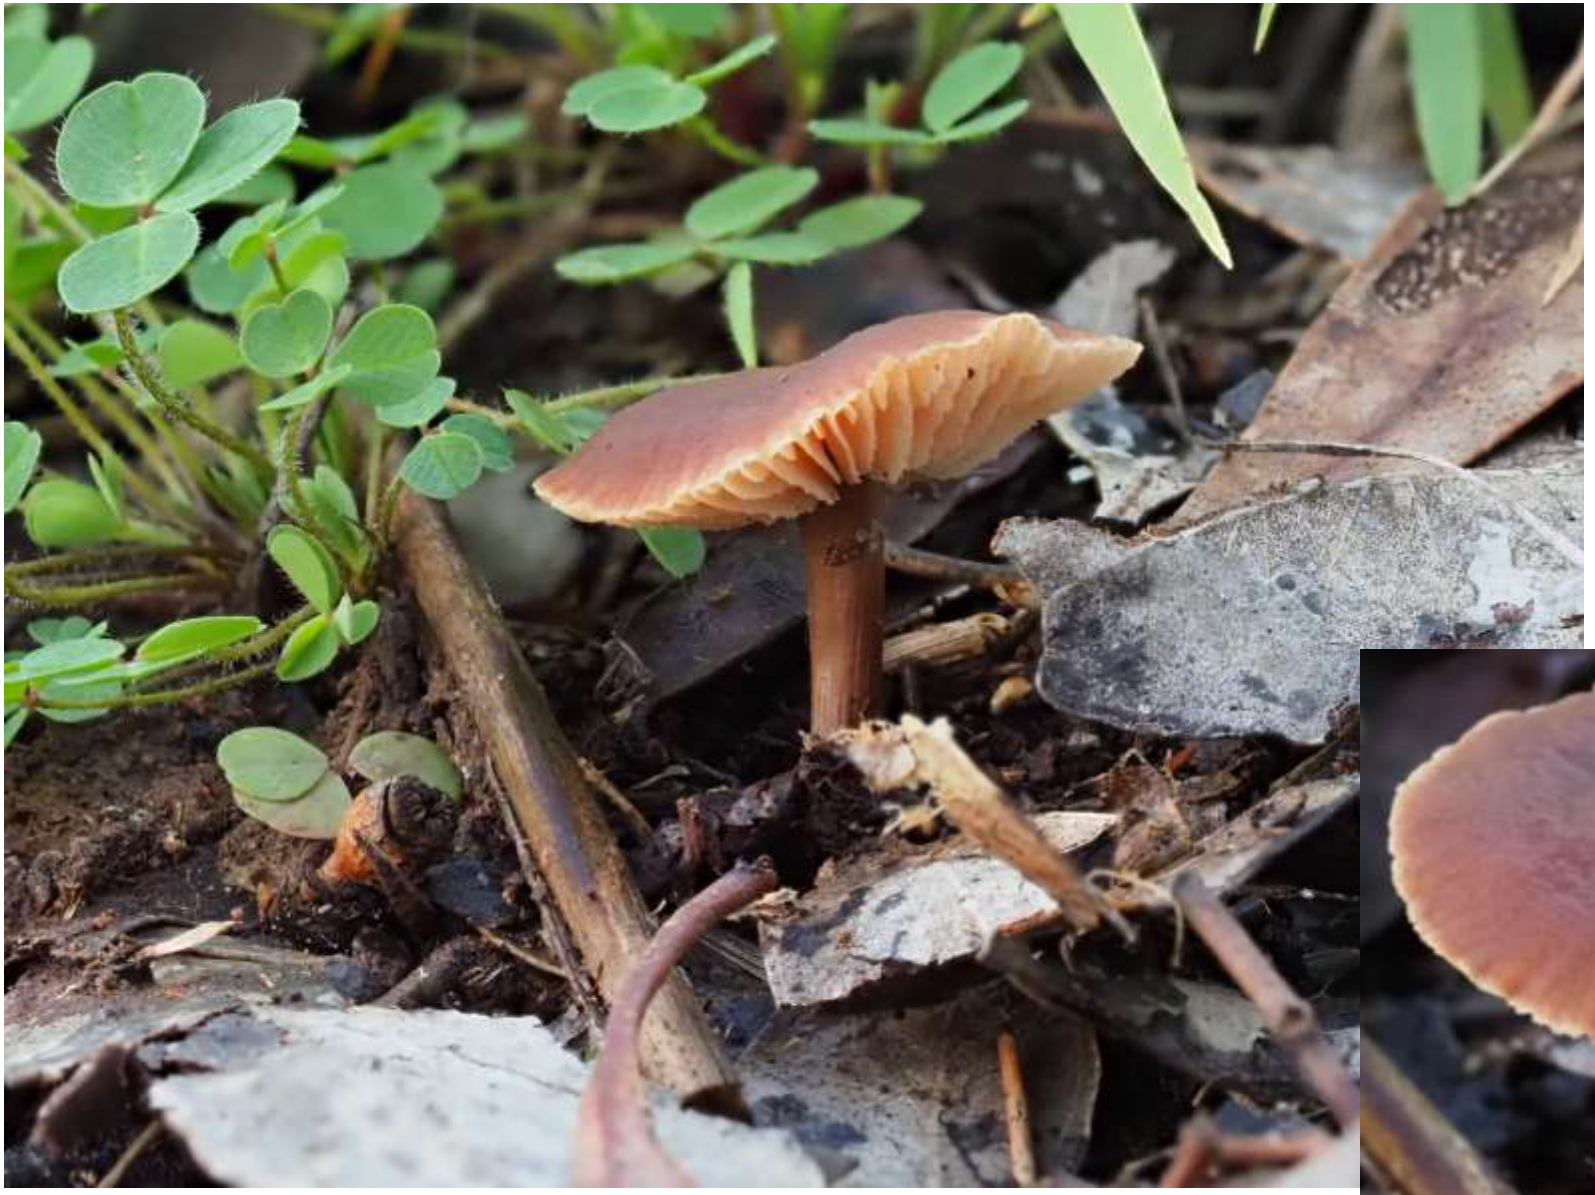


Location: Umbagong District Park **Date:** 30 March 2014

Identification: Likely to be *Parasola sp.* Other possibilities: *Coprinopsis sp. / Coprinellus sp.*

Approximate location: Lat**:** -35.2146667; Long: 149.0239861 **Date:** 20 June 2020 **Identification:** *Pycnoporus coccineus*

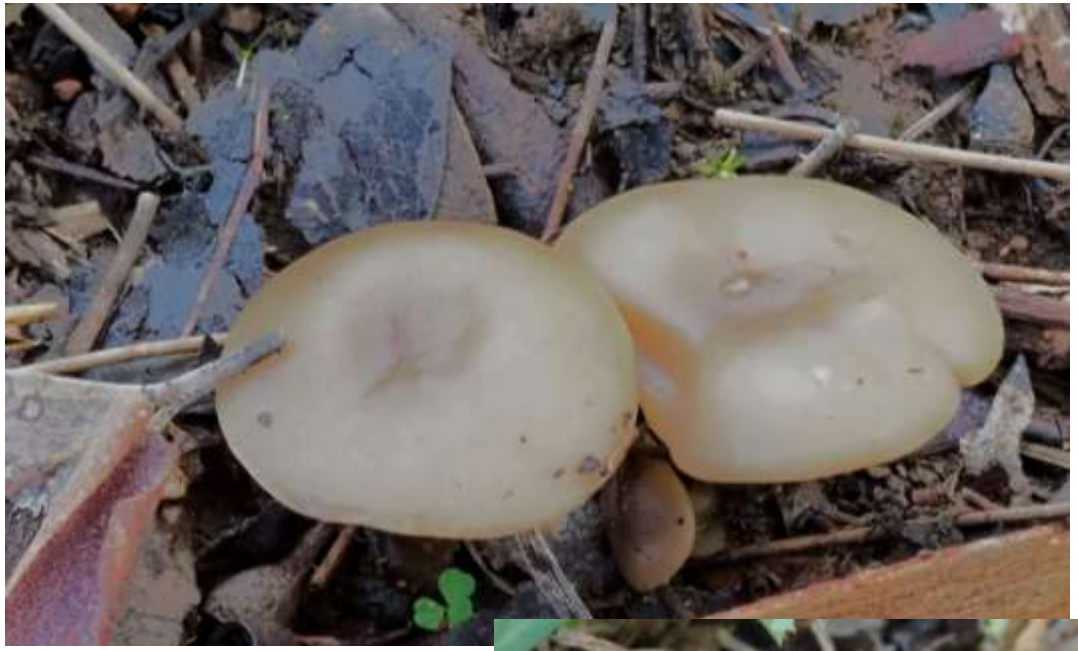
Approximate location: Lat: -35.2146278; Long: 149.0241139 **Date:** 20 June 2020 **Identification:** Possibly *Collybia s.l.*
Comments: above and below are the same species found in a moist, shaded area. Many that looked like the same species found at Lat: -35.216423; Long: 149.020959.



Approximate location: Lat: -35.2147472; Long: 149.0241723 **Date:** 21 June 2020

Identification: Possibly *Collybia s.l.* **Comments**: A single mushroom found several metres downslope of the cluster shown in the previous pages. Stalk much browner.

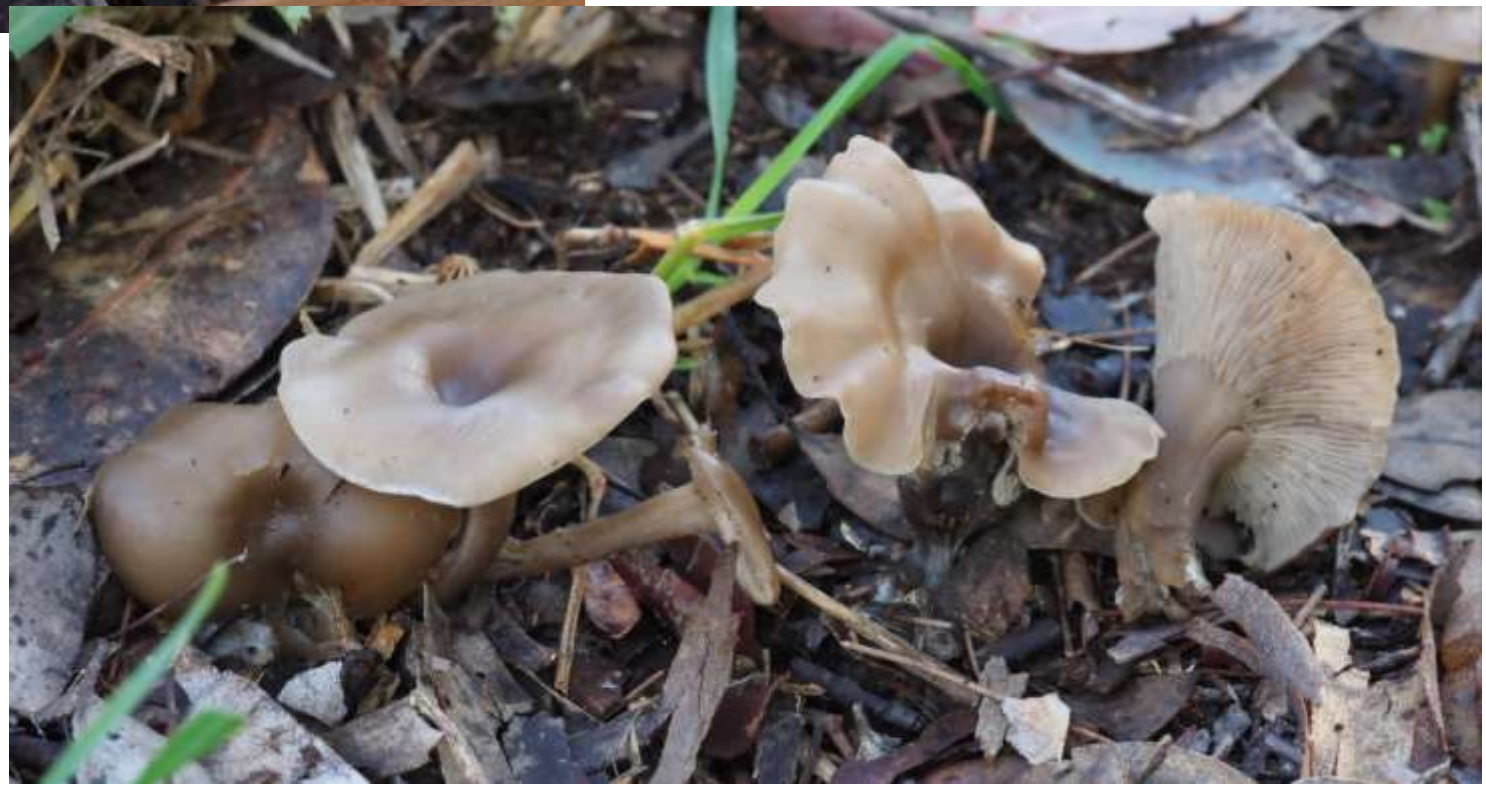
Approximate location: Lat: -35.2147472; Long: 149.0241723 **Date:** 20 June 2020 **Identification:** *Clitocybe s.l.*

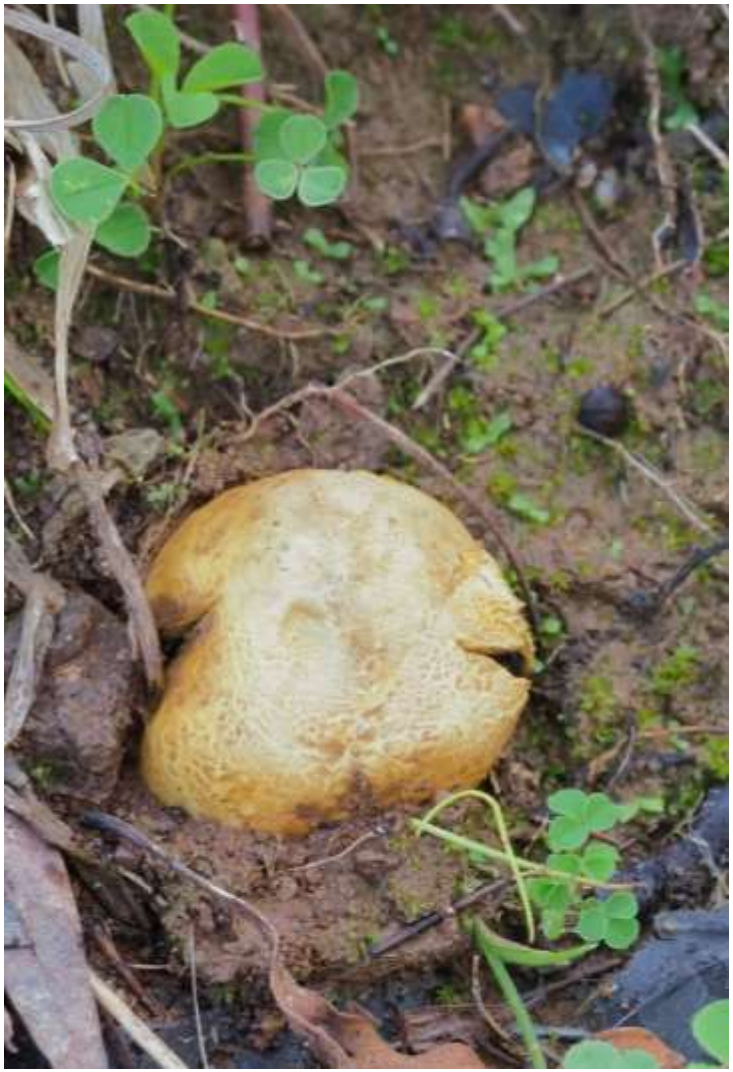


Approximate location: Lat: -35.2147472; Long: 149.0241723

Date: 21 June 2020

Identification: *Clitocybe s.l.*





Approximate location: Lat: -35.2147472; Long: 149.0241723 **Date:** 21 June 2020

Identification (above): *Clavulina sp.* (likely)

Comments: A fairly common grey or brownish-grey coral fungus, but the colour makes it easy to overlook even good-sized specimens when they grow in leaf/twig litter. Sometimes separate fruitbodies grow so close together that they merge to produce a quite irregular shape (Heino Lepp)

Identification (right): *Scleroderma sp*.

Approximate location: Lat: -35.2152139; Long: 149.0261306 **Date:** 25 June 2020 (above) 20 June 2020 (below) **Identification:** unknown

Comments: In Casuarina tree litter
